

*The 3rd TRIZ Symposium in Japan  
Held by Japan TRIZ CB  
Aug. 30 - Sept. 1, 2007 in Yokohama*

**How to Prevent Unauthorized Persons  
from Entering the Auto-locking Door of Apartment Building:  
Applying TRIZ/USIT to  
A Social & Technical Problem**

*August 31, 2007*

*TOSHIBA Kenshu Center (Shin-Yokohama, Yokohama)*

**Toru Nakagawa and Arata Fujita  
Osaka Gakuin University**

## **Outline of our Talk:**

Thesis work by Fujita (Mar. 2007) + Further research by Nakagawa.

To try to solve an everyday-life problem creatively.

'How to Prevent Unauthorized Persons from Entering  
the Auto-locking Door of Apartment Building'

Such person can enter the door, simply by following a resident.

Not only technical but also human and social problem, in its nature.

We applied TRIZ/USIT in a smooth way.

Students' group discussions on issues guided with TRIZ/USIT.

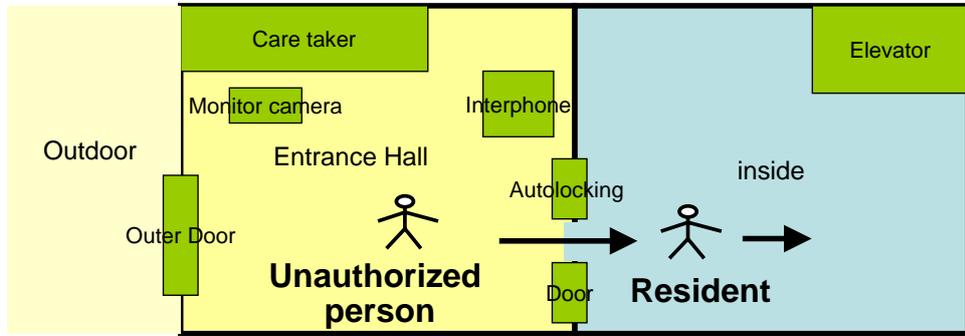

3 Main Causes were found. -- We need to solve them all.

We propose a new Scheme/System of Auto-locking Door.

Primarily based on a solution in human psychology and social manner,  
a clear technical solution ensures the security.

# Problem Definition (with USIT)

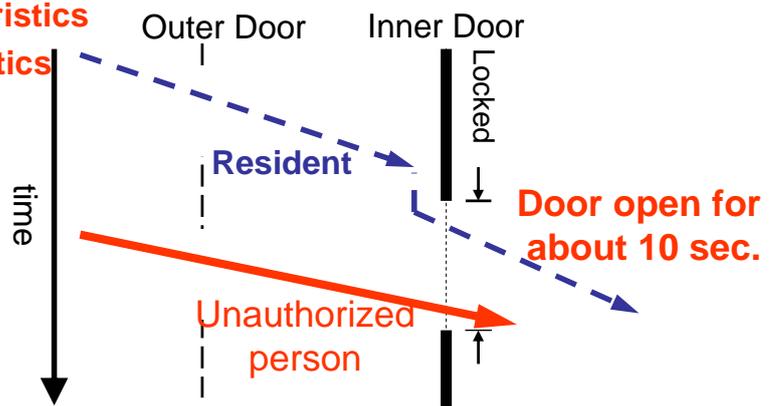

- (a) **Undesirable Effect:** In an apartment building with an auto-locking door system, unauthorized persons can enter the door easily and break the security.
- (b) **Task/Goal:** To ensure the security of the apartment building by preventing the unauthorized persons from entering the auto-locking door .
- (c) **Sketch of the problem situation:**

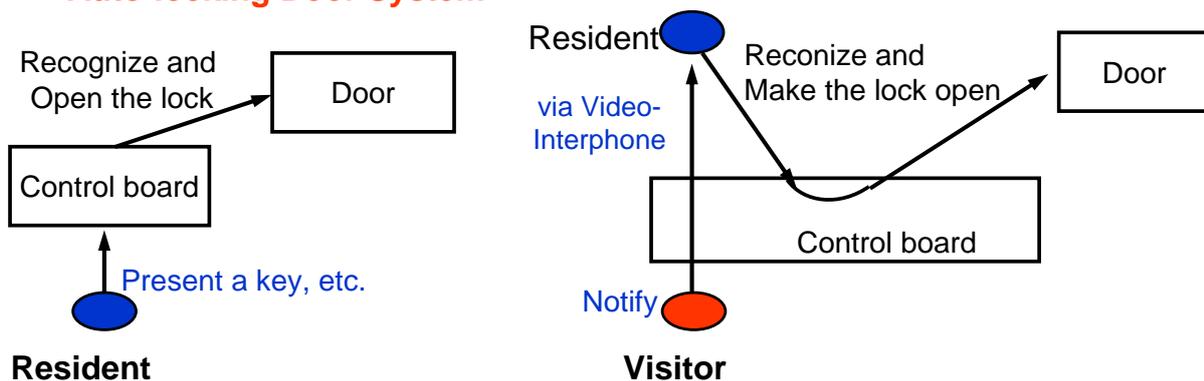

- (d) **Plausible Root Causes:** The unauthorized person, behaving like a resident, can enter the door opened by a resident simply following after him/her.
- (e) **Minimum Set of Relevant Objects:** Entrance door, Control system, an unauthorized person, a resident who goes ahead

## Analyze the Problem (USIT, TRIZ, etc.)

- (a) **Analysis of Space Characteristics**
- (b) **Analysis of Time Characteristics**

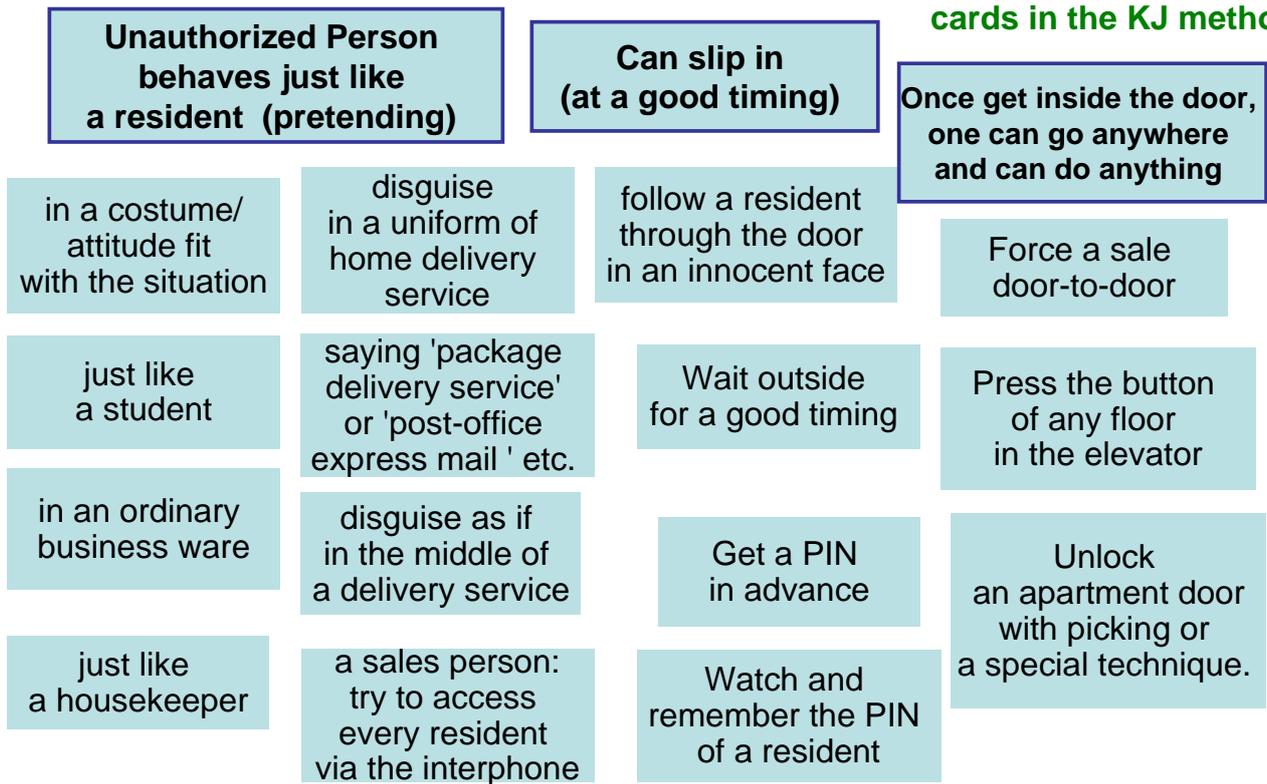

- (c) **Current means:**  
**Auto-locking Door System**

**(d) Analysis of Behavior of the Unauthorized [Subversion Analysis]**

View from the unauthorized person

Discuss freely, and organize the recorded cards in the KJ method.

**(e) Analysis of residents' behaviors: Search for root causes in their psychology**

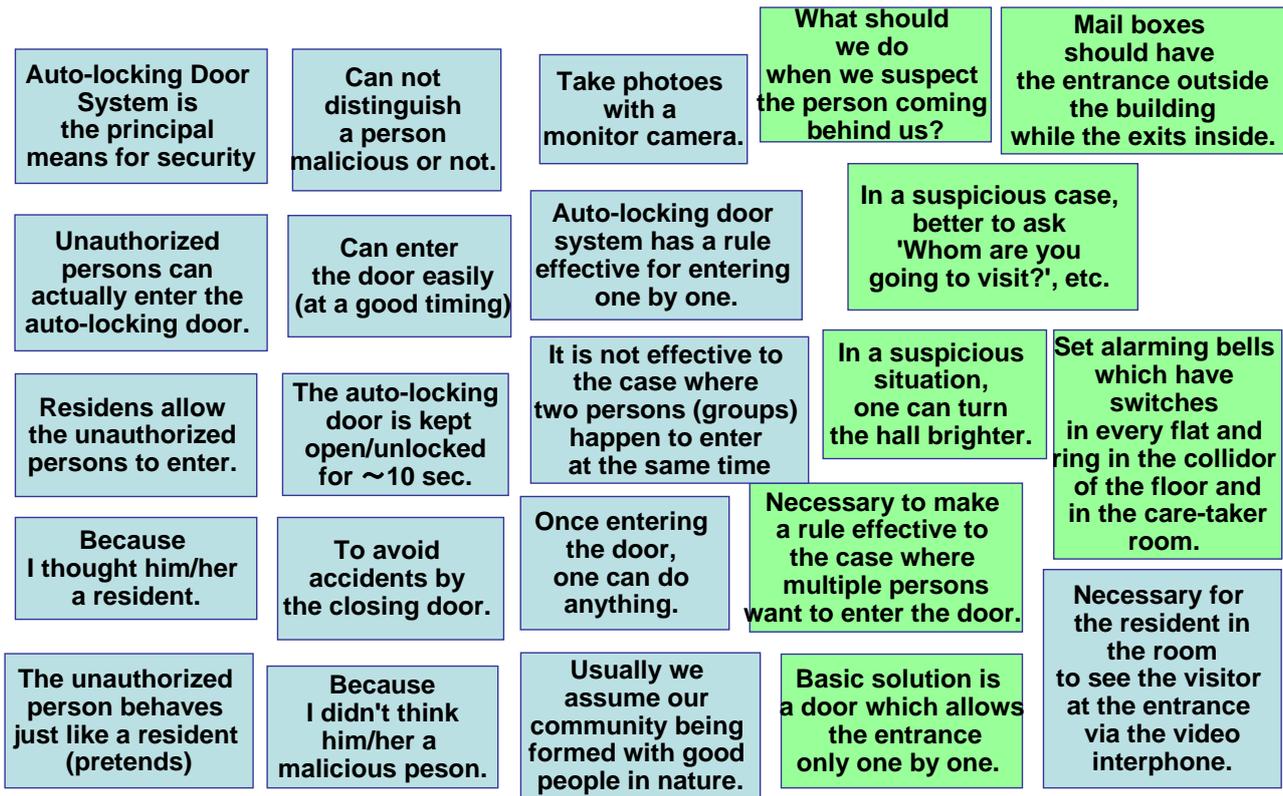

**Residents allow the unauthorized persons to get in.**

We must be precautious against risks.

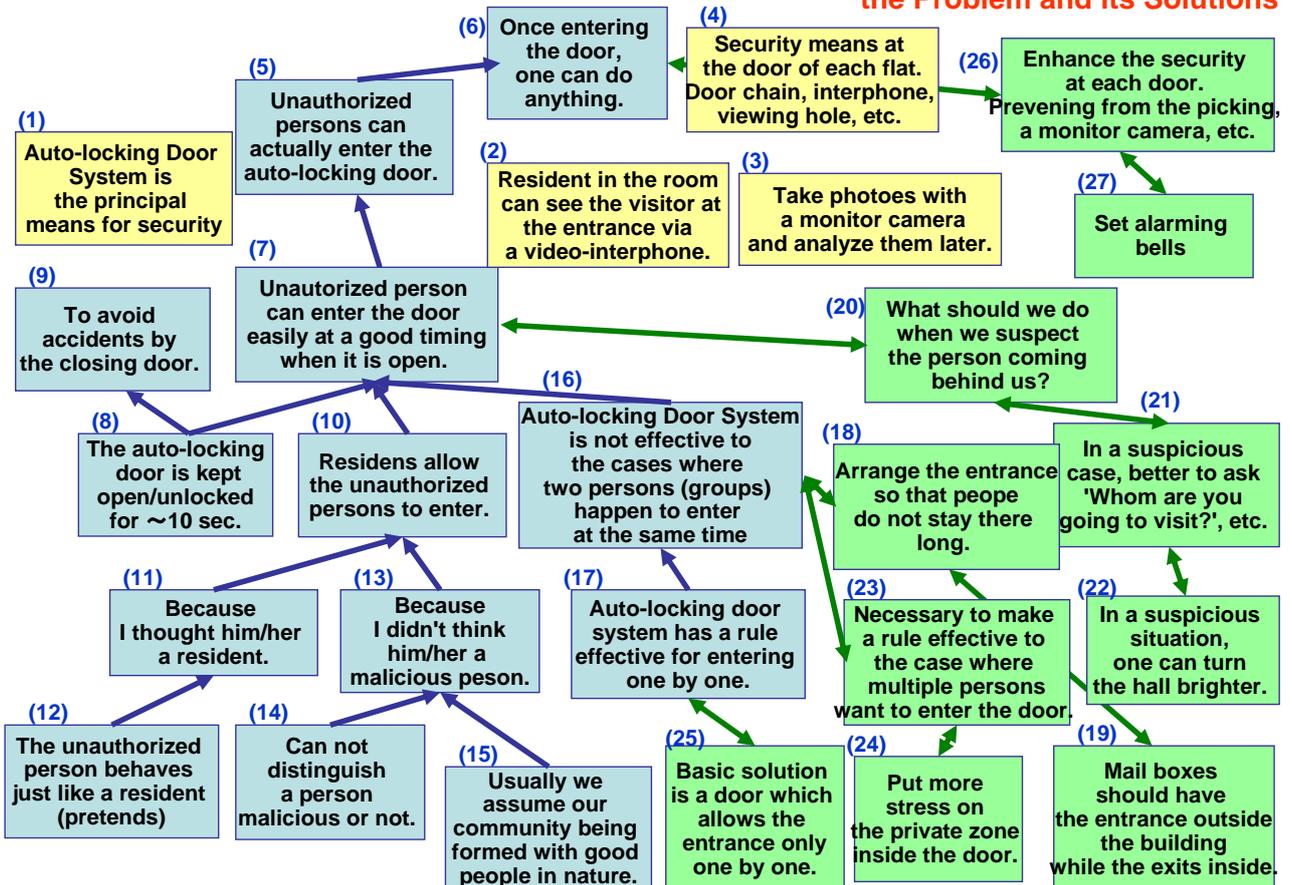

## How to Prevent Unauthorized persons from entering the Autolocking Door of Apartment Building

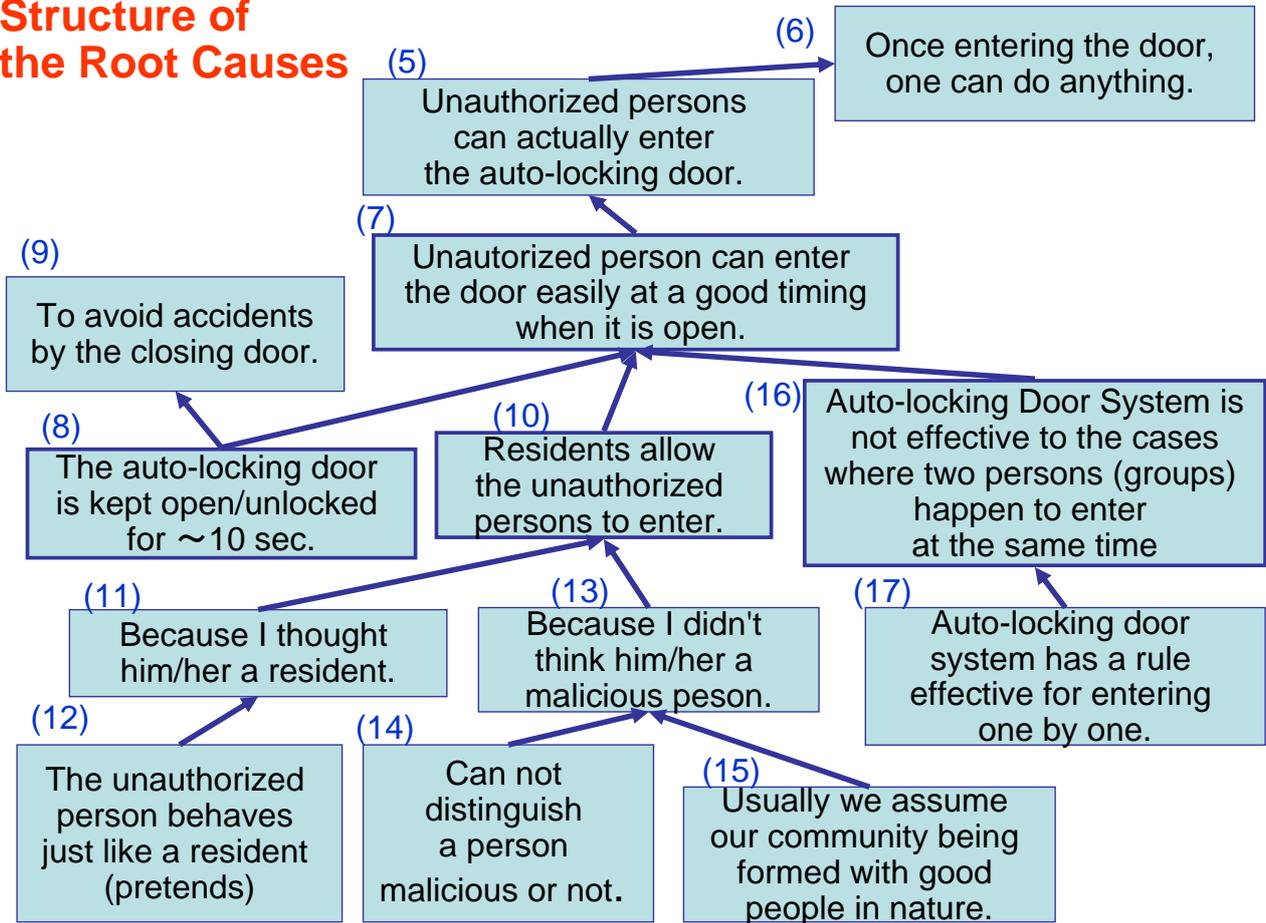

Collect the upper-level cards and put them in a glance to consider the logical relationships among them.

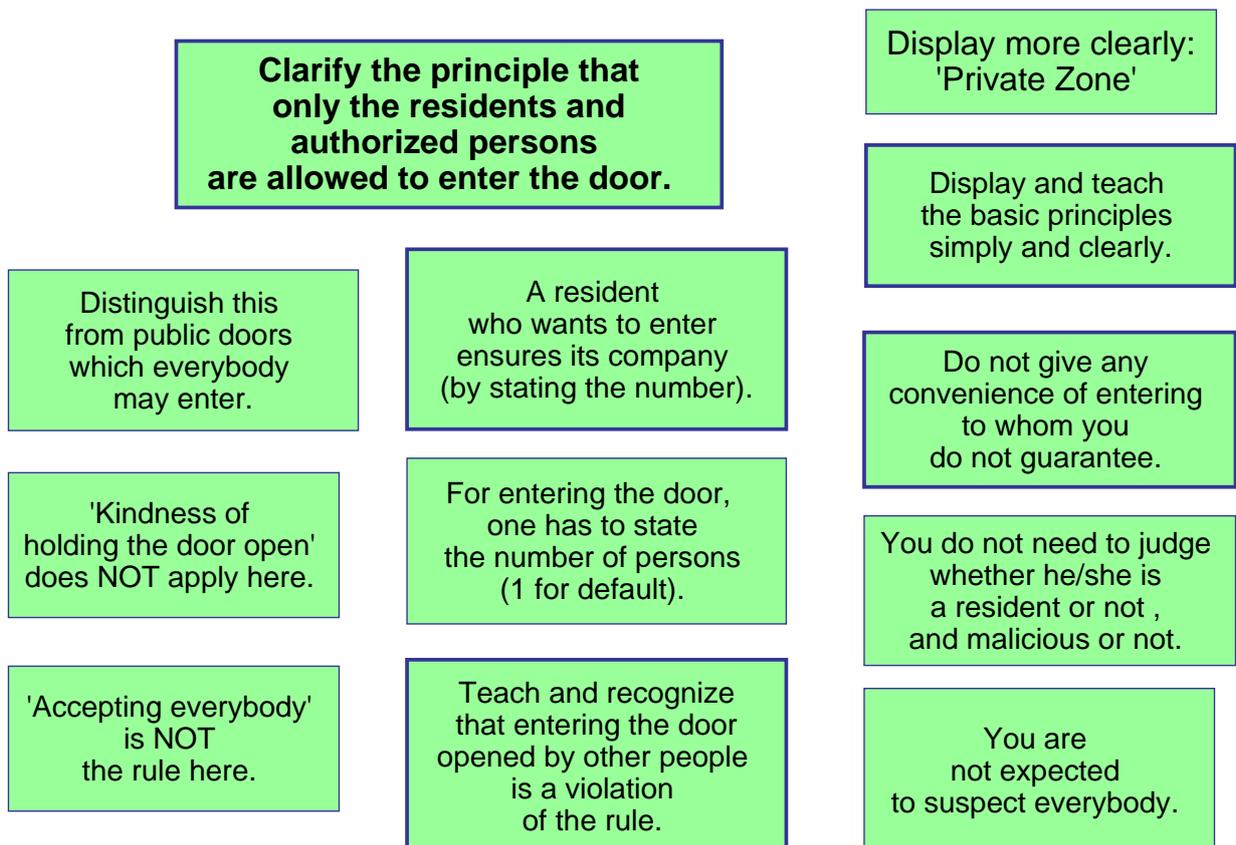

## Increasing Security with the Auto-locking Door System: Overall Structure of the Problem and its Solutions

## Structure of the Root Causes

## Solving Problem (1) 'Residents allow the unauthorized persons to enter'

## Solving Problem (2) 'System is not effective when two groups happen to meet.'

Must clarify the rule when two (or multiple) groups happen to meet in front of the door.

Display and teach the basic principles simply and clearly.

Each group is responsible for getting authorized by operating the key (or something equivalent)

Even while the door is open, System must be able to accept the authorization procedure by the next group.

Passing through the door opened by a preceding group is a violation of the rule.

System should detect that the next group is likely to violate the rule and make a notice immediately.

When you find the group next to you is suspicious, ask them 'Whom are you going to visit?', etc.

System must detect the violation by the next group and make an alarm immediately.

## Solving Problem (3) 'The auto-locking door is kept open/unlocked for 10 sec.'

To avoid accidents by the closing door, the big, heavy door should be moved slowly and operated on the safety side.

The number of people who have passed/ are going to pass should be detected real time by an IT system.

Display and teach the basic principles simply and clearly.

After the number of people registered so far have entered, display 'After getting authorized, please enter the door.' etc.

With image processing, the System determines how many entered and how many are likely to enter.

Responding in real time, proper displays and announcements are made for instruction and notice.

To avoid the entering from sides, set poles and ropes besides the door.

When more than the registered number are going to enter, the System displays and announces a notice.

Responding in real time, displays, announcements, alarms, photo recordings are made with increasing levels of alert.

When more persons have entered in violation, the System tells a warning and takes a photo with lighting.

Records of alarm cases are analysed later systematically to manage individually.

## **Solution: A New Control System of Auto-locking Door (Part 1)**

- (1) Display: "Private Zone Inside This Door."  
"Residents and authorized persons ONLY are allowed to enter."
- (2) Display: "Each person (or each group) should get authentication for yourself.  
Even while the Door is Open, the authentication process is accepted.  
Independent of the Door status, start the authentication process.  
Entering the Door without authentication is a violation of the rule and law."
- (3) Display: "Residents: Use the panel Left to the Door.  
Visitors: Use the panel Right to the Door. "
- (4) Display (on the Left Panel): "For Residents: Insert your key, Input the number of your group at moment (1 if you are alone), and turn and remove the key."
- (5) Display (on the Right Panel): "For Visitors: Press the residence No. you are going to visit, and talk with the resident via the video interphone.  
Get the approval by the resident, telling number of persons of your group.  
When lamp(s) turn on for your group, please enter the door."

## **Solution: A New Control System of Auto-locking Door (Part 2)**

- (6) The Door itself is operated slowly and safely, just as usual at present:  
Opens slowly, closes slowly, being unlocked for about 10 seconds, and re-opens in case of any obstacle for the purpose of safety.
- (7) An IT system is built for giving door control operations. The system must have image processing ability and work with the panels for authentication.
- (8) The IT System monitors with a video camera around the door, and understands in real time the accumulated number ( $e$ ) of persons who have entered the door (since the door is opened this time) and the number of persons who are going to enter the door.
- (9) The IT System cooperates with the panel for authentication operation and understands in real time the accumulated number ( $a$ ) of persons who are approved in the authentication (relevant to the door opening of this time).
- (10) 'Number of persons left with authentication' ( $p$ ) is defined by 'accumulated number of authenticated persons' ( $a$ ) minus 'accumulated number of persons entered the door' ( $e$ ).  $p$  is used for giving door-open/close orders and for controlling the notice/alarm displays.

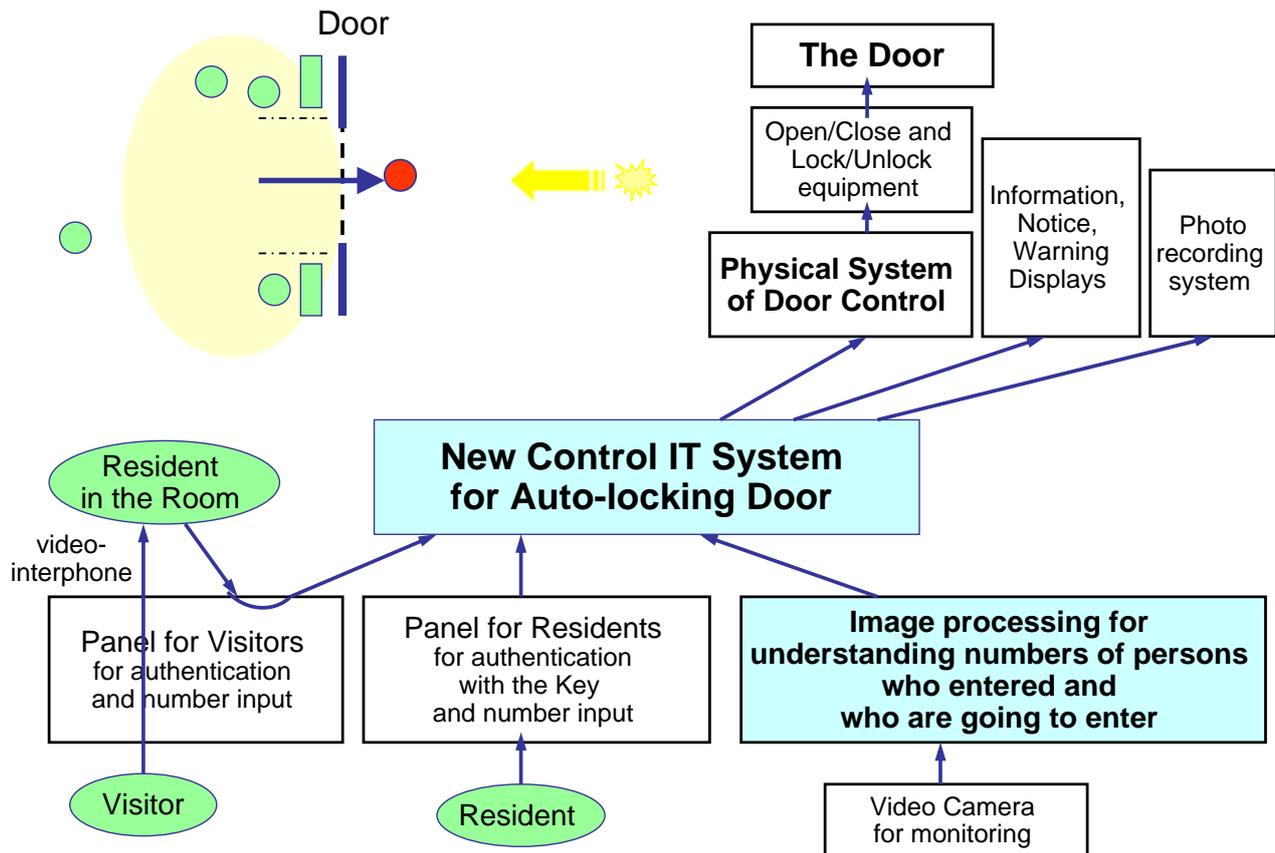

### **Solution: A New Control System of Auto-locking Door (Part 3)**

- (11) While 'Number of persons left with authentication'  $p > 0$ , the System gives the Open-Door direction and displays 'Please enter' at the top of the Door.
- (12) While  $p = 0$ , the System gives the Close-Door direction and displays as 'Please get authentication on the panel, right (for residents) or left (for visitors) for entering the door'.  
This is a normal state. If the Door is open, it will start the closing motion. When the Door is closed and locked, the variables  $a$ ,  $e$ , and  $p$  are reset to be 0.
- (13) While  $p = 0$  and the Door is not locked, if the System detects any person who is going to enter the Door, it makes the display (12) on and off, and make an announcement for notice.
- (14) When  $p$  turns to negative (and also increases in its absolute value with  $p < 0$ ), the System has detected a violation of the rule.  
Thus it turns the flash light on and takes a photo from front of the person who has just entered the Door. And it displays and announces as 'Since it is detected that more persons than those authenticated have entered the door, a photo is taken for the security reasons. To avoid this inconvenience, please enter the Door after getting authentications.'

### **Solution: A New Control System of Auto-locking Door (Part 4)**

- (15) While  $p > 0$  and nobody has entered for the last preset period of time (say 10 sec), the System gives the Close-Door direction.  
When the Door gets closed and locked, the variables  $a$ ,  $e$ , and  $p$  are reset to 0.
- (16) The records of operations, especially the photos taken, are analyzed later, desirably every day, by the manager for the purpose of making appropriate means both individually and generally for increasing the security of the building.

## Solution: A New Control System of Auto-locking Door

## Conclusion

TRIZ/USIT has been applied to the Security Problem of Auto-locking Door System.

Analysis: Human psychology and social understandings are important factors. Viewed with many different perspectives. Used KJ Method as well. Clarified the Cause-Effects relationships.

Solution Generation:

Considering psychology and social manner, a rule has been set up clearly. A new technical system has been designed to enforce the rule.

An IT Control System was designed using real-time image processing. On the basis of information, the Door Open/Close is logically controlled and notice and warning are displayed.

Physically, the big and heavy Door is slowly opened/closed and operated on the safety side to avoid any accidents.

TRIZ Principle 28: Substitution of Mechanical System  
 Mechanical & Physical Door ==> IT & Logical Door

**An everyday-life problem was solved by use of TRIZ/USIT with the perspectives of Society, Human, and Technology.**
