Applying TRIZ/USIT to A Social & Technical Problem: Auto-locking Door System of Apartment Building

**Toru Nakagawa and Arata Fujita
Osaka Gakuin University, Japan**

*Nov. 5, 2008
The University of Twente
Enschede, The Netherland*

Outline of our Talk:

Based on Thesis work by Fujita + further research by Nakagawa.

To try to solve an everyday problem creatively:

'How to Prevent Unauthorized Persons from Entering
the Auto-locking Door of Apartment Building'

Such a person can enter the door, simply by following a resident.

We found 3 main causes: technical, human psychological, and social ones.

Students' group discussions were guided with TRIZ/USIT, and
analyzed with the KJ method and RCA+ diagram, etc.

We propose a new Scheme/System of Auto-locking Door:

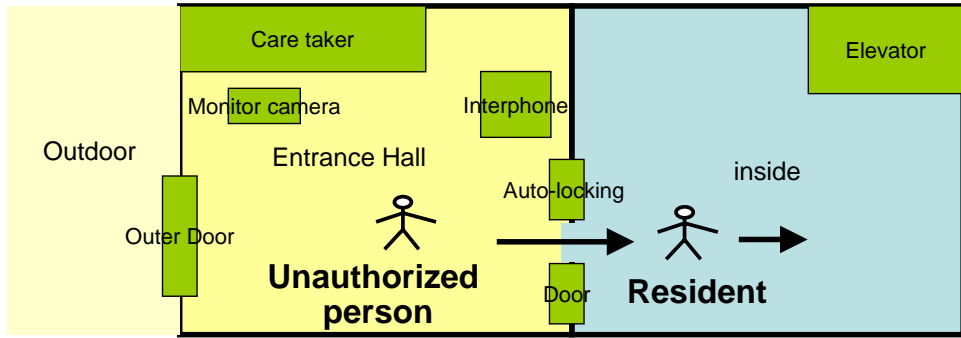

IT & logical system of door control is introduced
over the current Mechanical & physical control system.

This will solve all the three aspects of problems together.

Problem Definition

USIT method

- (a) **Undesirable Effect:** In an apartment building with an auto-locking door system, unauthorized persons can enter the door easily and endanger the security.
- (b) **Task/Goal:** To ensure the security of the apartment building by preventing the unauthorized persons from entering the auto-locking door .
- (c) **Sketch of the problem situation:**

- (d) **Plausible Root Causes:** The unauthorized person, behaving like a resident, can enter the door opened by a resident simply by following him/her.
- (e) **Minimum Set of Relevant Objects:** Entrance door, Control system, an unauthorized person, a resident who goes ahead

Analyze the Problem

USIT method

- (a) **Analysis of Space Characteristics**
- (b) **Analysis of Time Characteristics**

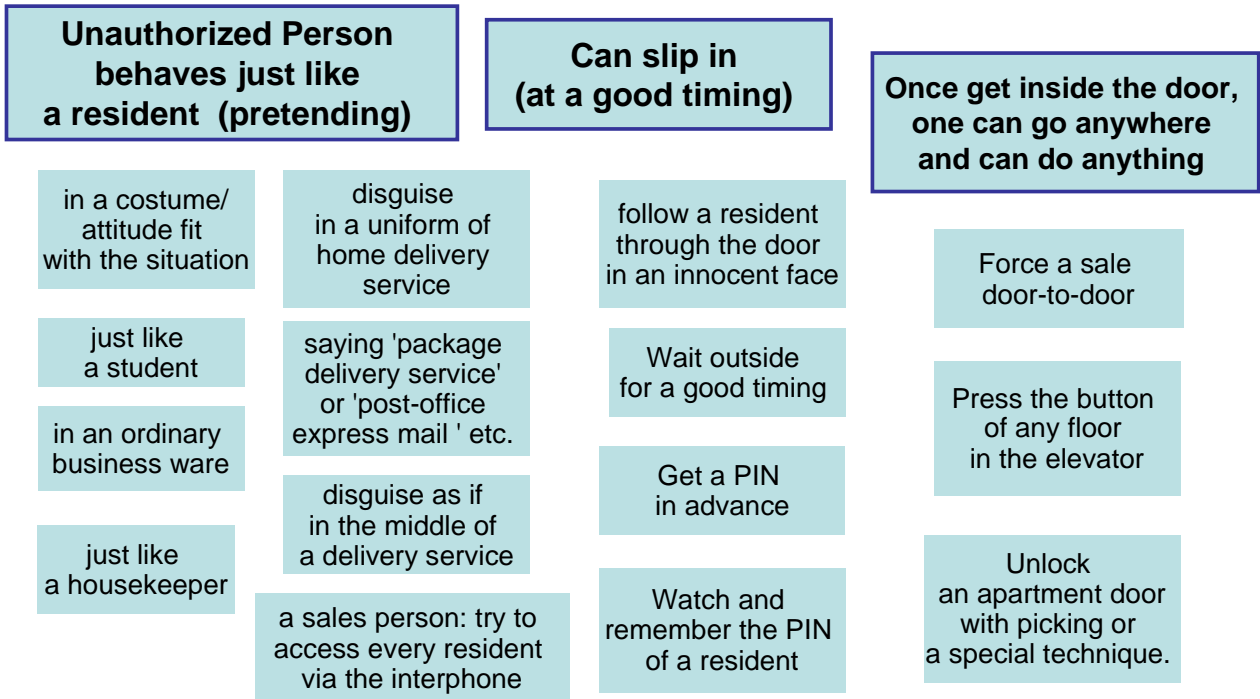

- (c) **Current means:**
Auto-locking Door System

(d) Analysis of Behavior of the Unauthorized

View from the unauthorized person
[Subversion Analysis]

Students' discussion was facilitated. The recorded the cards were reorganized in the KJ method (i.e. Affinity diagram method).

(e) Analysis of residents' behaviors:

Search for root causes in their psychology

Students' discussion was facilitated. The recorded the cards were reorganized in the KJ method.

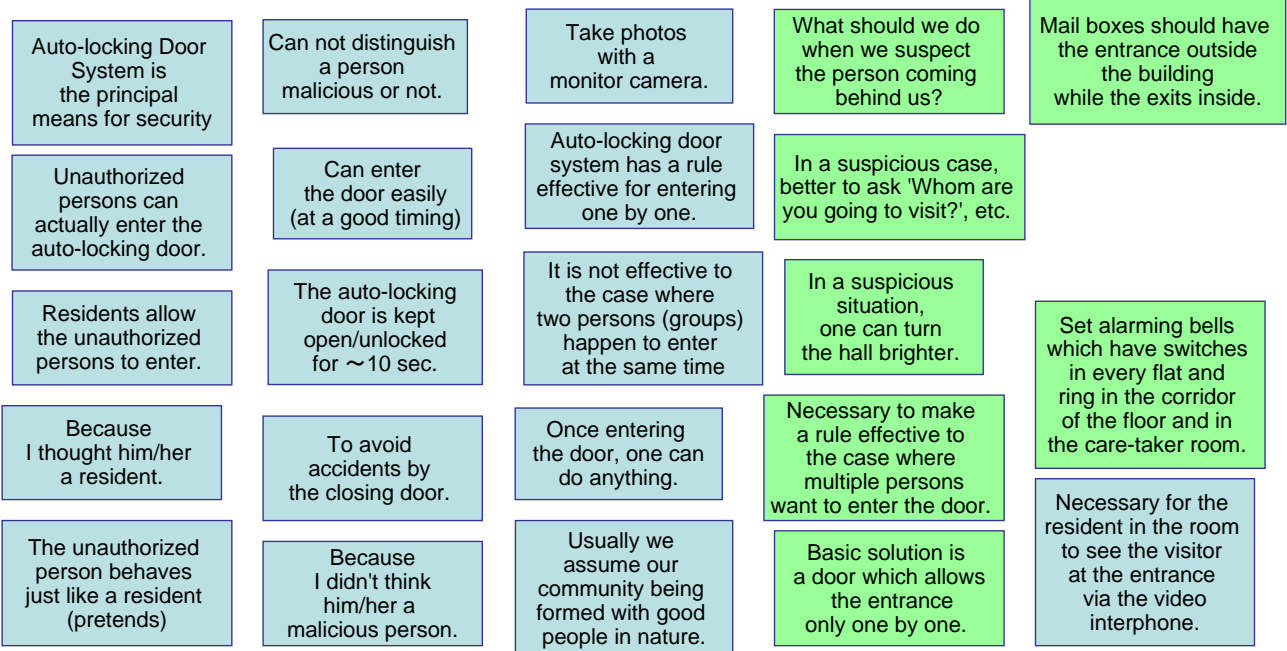

Some solution ideas came out

(f) Collect all relevant information

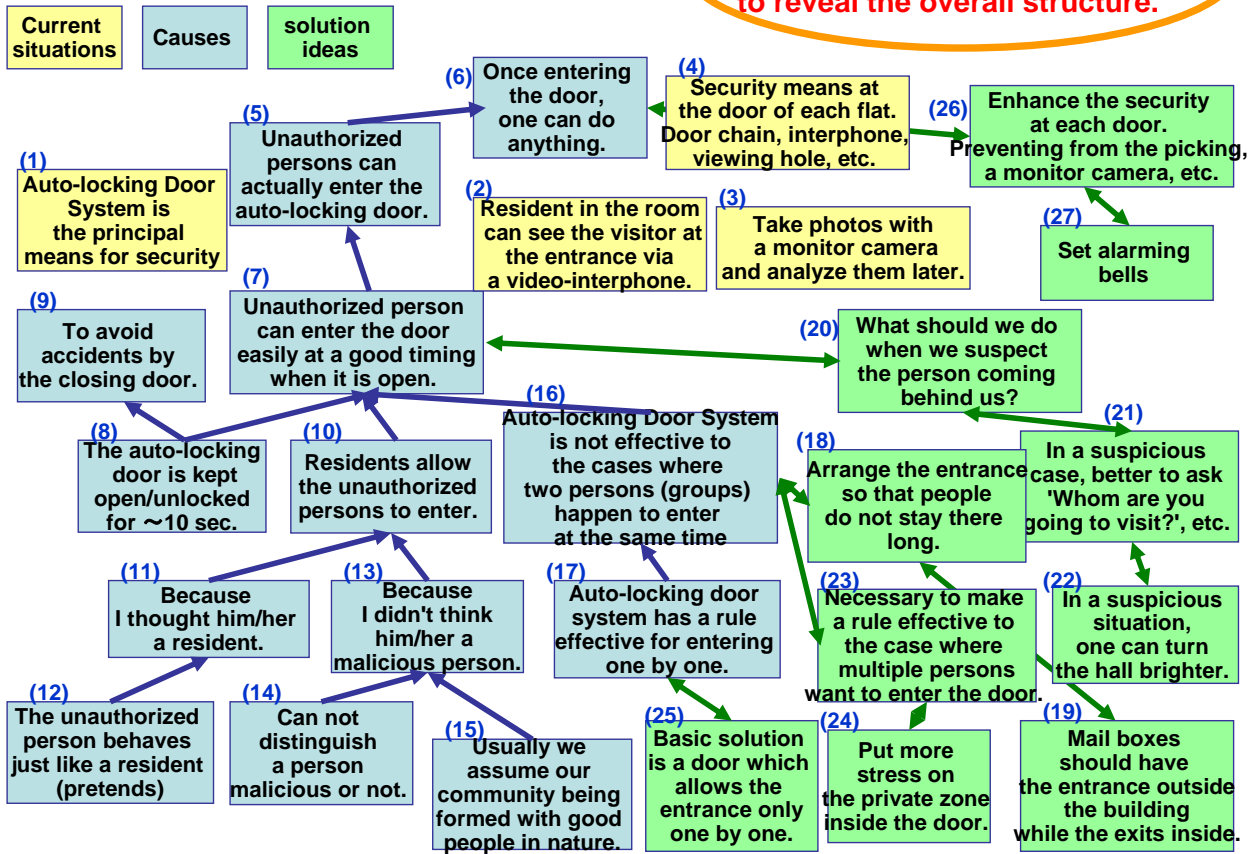

How to Prevent Unauthorized persons from entering the Auto-locking Door of Apartment Building

Collect the upper-level cards and put them in a glance to consider the logical relationships among them.

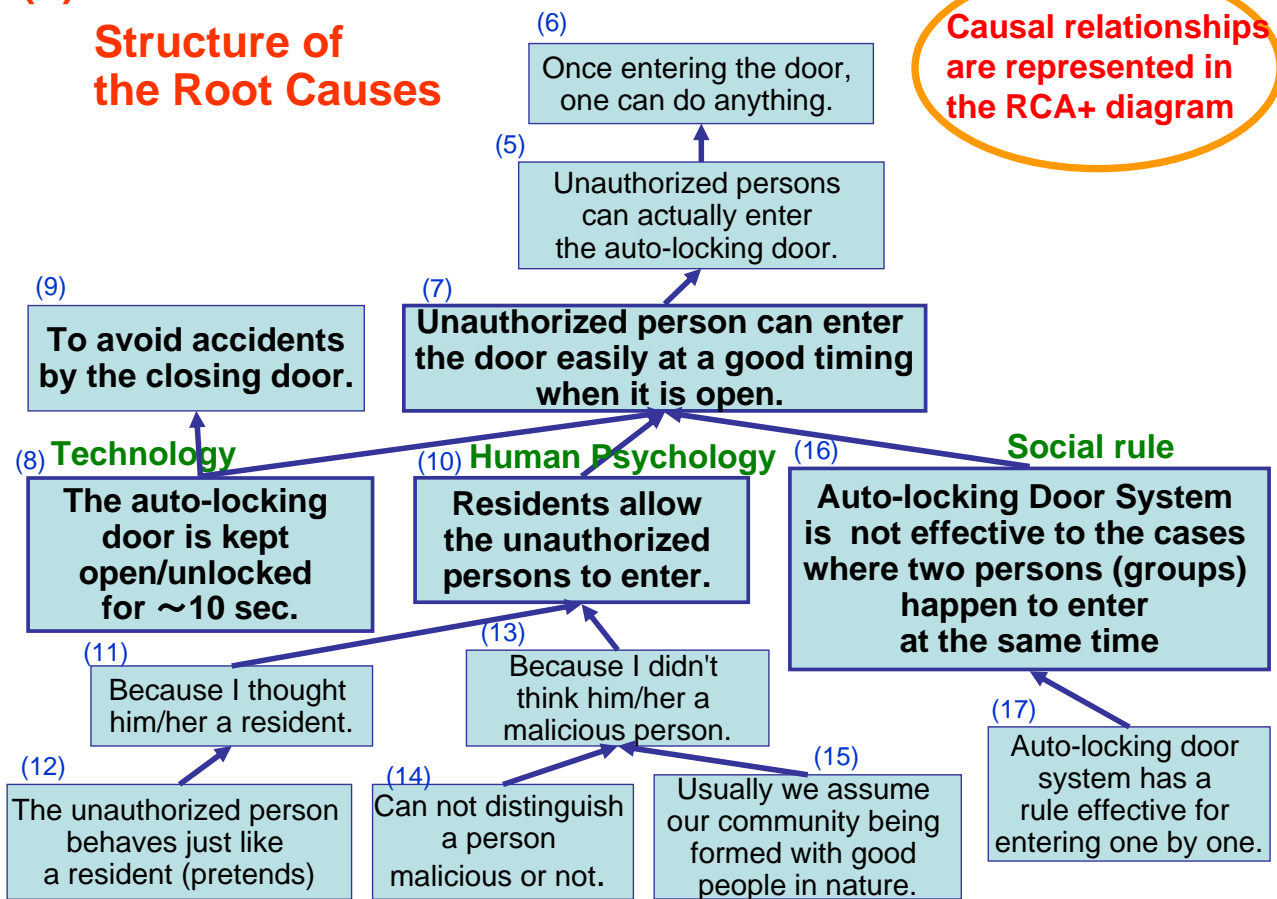

(g) Understanding the Overall Structure of the Problem

Use the KJ Method to consider the relationships among the cards and to reveal the overall structure.

(h) Essence of the Problem

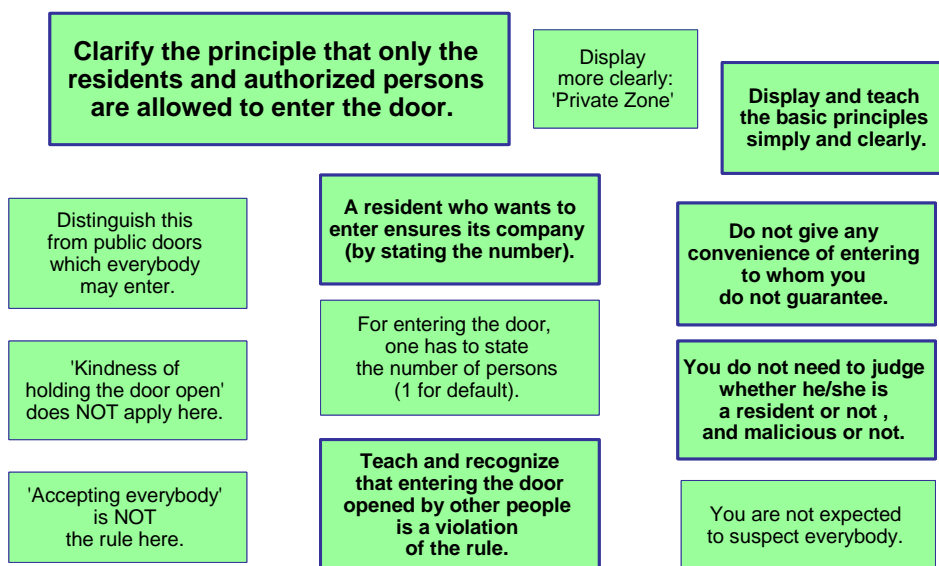

Structure of the Root Causes

Idea Generation (1)

Solution ideas to 'Residents allow the unauthorized persons to enter'

Ideas from students' discussions were later enhanced and reorganized.

Clearly distinguish the Private Zone Entrance from the Public Entrances.

System should not request the residents to judge about others, but to declare about his/her accompanies.

Idea Generation (2)

**Solution ideas to
'System is not effective when two groups
happen to meet.'**

**Ideas from students'
discussions were later
enhanced and reorganized.**

Must clarify the rule when two (or multiple) groups happen to meet in front of the door.

Each group is responsible for getting authorized by operating the key (or something equivalent)

Passing through the door opened by a preceding group is a violation of the rule.

When you find the group next to you is suspicious, ask them 'Whom are you going to visit?', etc.

Display and teach the basic principles simply and clearly.

Even while the door is open, System must be able to accept the authorization procedure by the next group.

System should detect that the next group is likely to violate the rule and make a notice immediately.

System must detect the violation by the next group and make an alarm immediately.

- Inconvenient rigorous rules do not work.
- The authentication need to be processed at any time.
- Our System need to be intelligent.
- The new social rule: "Every party must get the authentication for themselves regardless of the door being open or closed."

Idea Generation (3)

**Solutions to 'The auto-locking door
is kept open/unlocked for 10 sec.'**

**Ideas from students'
discussions were later
enhanced and reorganized.**

To avoid accidents by the closing door, the big, heavy door should be moved slowly and operated on the safety side.

The number of people who have passed / are going to pass should be detected real time by an IT system.

Display and teach the basic principles simply and clearly.

With image processing, the System determines how many entered and how many are likely to enter.

Responding in real time, proper displays and announcements are made for instruction and notice.

After the number of people registered so far have entered, display 'After getting authorized, please enter the door.' etc.

When more than the registered number are going to enter, the System displays and announces a notice.

Responding in real time, displays, announcements, alarms, photo recordings are made with increasing levels of alert.

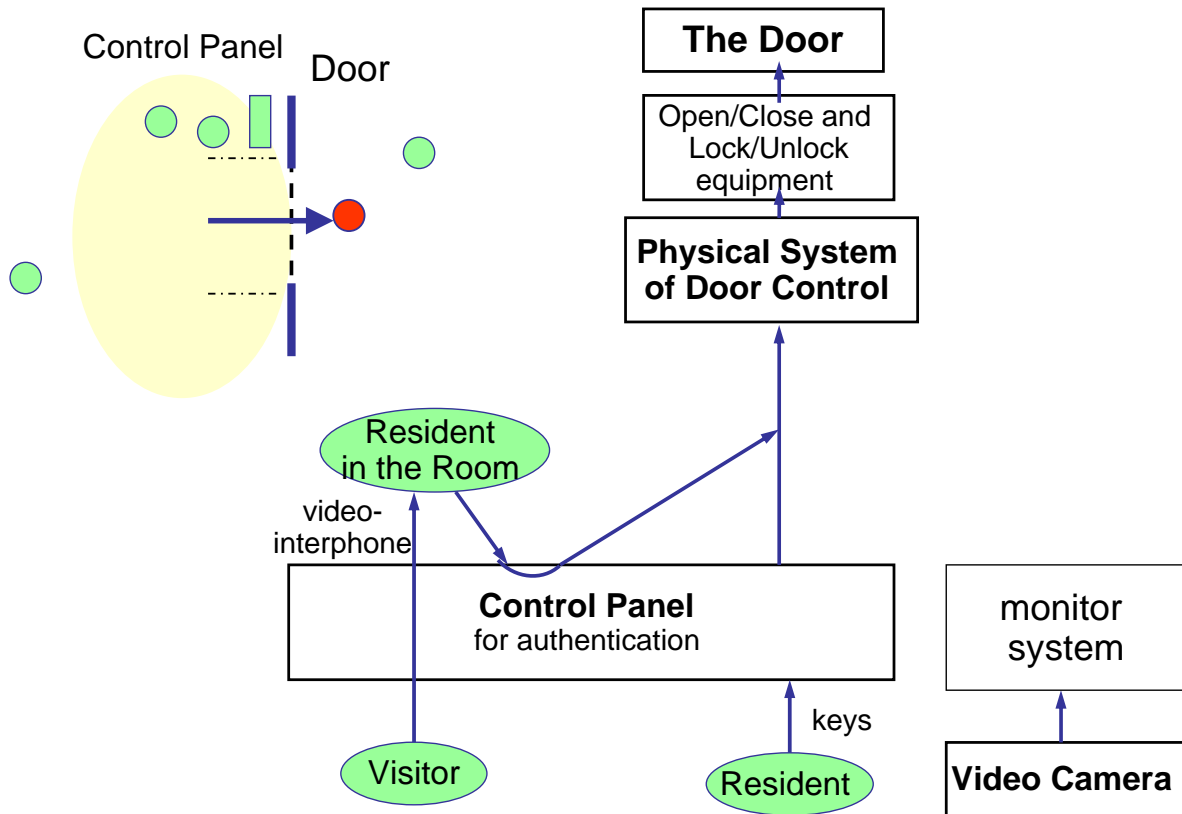

To avoid the entering from sides, set poles and ropes besides the door.

When more persons have entered in violation, the System tells a warning and takes a photo with lighting.

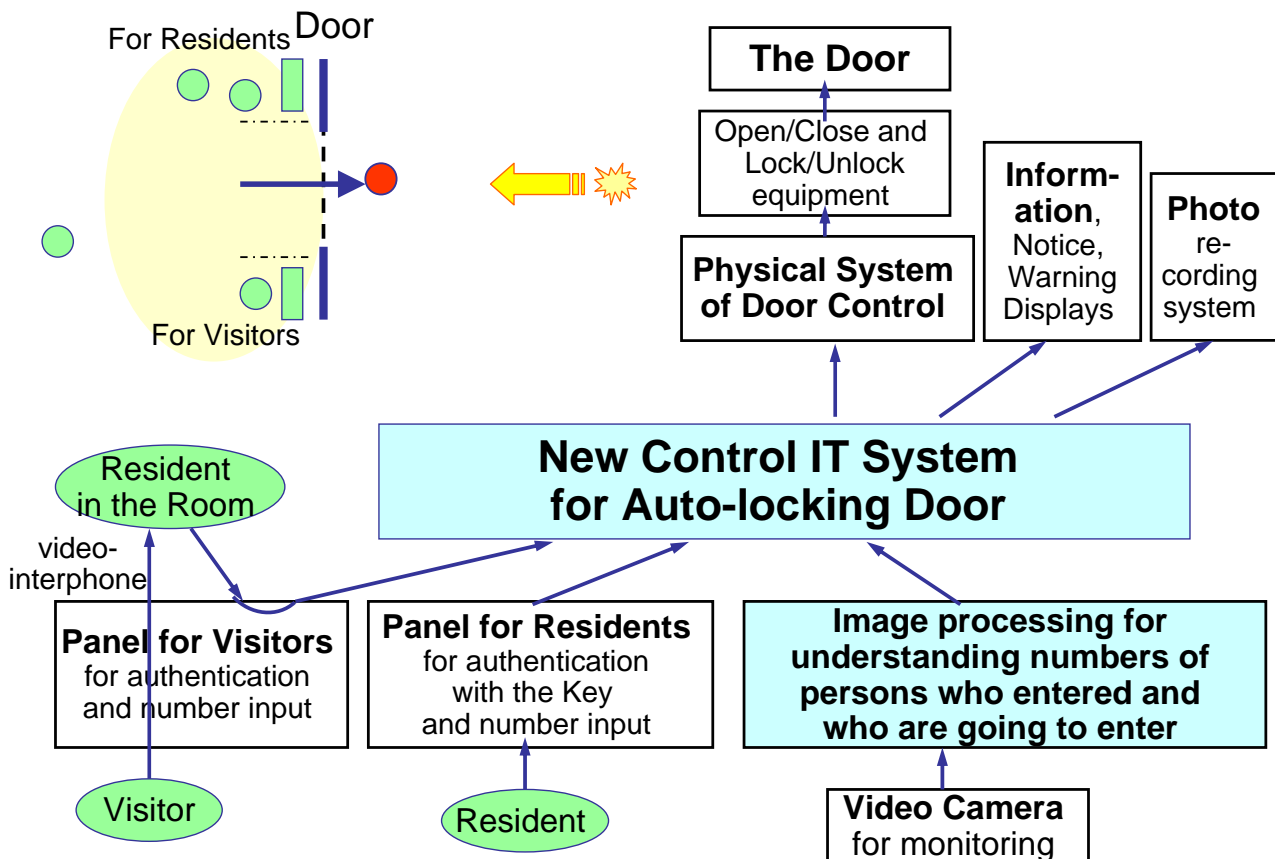

Records of alarm cases are analyzed later systematically to manage individually.

- Confirmation of the safety-first principle.
- To abandon the idea of physically forbidding the violation. Warning is enough.
- To allow a declared number of people to enter.
- To introduce a virtual and logical door with intelligence.
- Separation of residents and visitors in space.

Current Control System of Auto-locking Door

Our Solution: A New Control System of Auto-locking Door

Final Solution Concept: A New Control System of Auto-locking Door (Part 1)

Build up a solution concept,
in a consistent way.
Use all your capability!
(Nakagawa)

- (1) Display: "**Private Zone Inside This Door.**"
"Residents and authorized persons ONLY are allowed to enter."
- (2) Display: "Each person (or each group) should get authentication for yourself.
Even while the Door is Open, the authentication process is accepted.
Independent of the Door status, start the authentication process.
Entering the Door without authentication is a violation of the rule and law."
- (3) Display: "Residents: Use the panel Left to the Door.
Visitors: Use the panel Right to the Door. "
- (4) Display (on the Left Panel): "**For Residents: Insert your key, Input the number of your group** at moment (1 if you are alone), and turn and remove the key."
- (5) Display (on the Right Panel): "**For Visitors:** Press the residence No. you are going to visit, and talk with the resident via the video interphone.
Get the approval by the resident, telling the number of persons of your group.
When lamp(s) turn on for your group, please enter the door."

Final Solution Concept: A New Control System of Auto-locking Door (Part 2)

Build up a solution concept,
in a consistent way.
Use all your capability!
(Nakagawa)

- (6) **The Door itself is operated slowly and safely**, just as usual at present:
Opens slowly, closes slowly, being unlocked for about 10 seconds,
and re-opens in case of any obstacle **for the purpose of safety**.
- (7) **An IT system is built for giving door control operations.** The system must have image processing ability and work with the panels for authentication.
- (8) The IT System monitors with a video camera around the door, and **understands in real time the accumulated number (e) of persons who have entered the door** (since the door is opened this time) and the number of persons who are going to enter the door.
- (9) The IT System cooperates with the panel for authentication operation and understands in real time **the accumulated number (a) of persons who are approved** in the authentication (relevant to the door opening of this time).
- (10) **'Number of persons left with authentication' (p)** is defined by 'accumulated number of authenticated persons' (a) minus 'accumulated number of persons entered the door' (e).
p is used for giving door-open/close orders and for controlling the notice/alarm displays.

Final Solution Concept: A New Control System of Auto-locking Door (Part 3)

Build up a solution concept,
in a consistent way.
Use all your capability!
(Nakagawa)

- (11) While 'Number of persons left with authentication' $p > 0$, the System gives **the Open-Door direction** and displays 'Please enter' at the top of the Door.
- (12) **While $p = 0$** , the System gives **the Close-Door direction** and displays as **'Please get authentication on the panel**, right (for residents) or left (for visitors) for entering the door'.
This is a normal state. If the Door is open, it will start the closing motion.
When the Door is closed and locked, the variables a , e , and p are reset to be 0.
- (13) **While $p = 0$** and the Door is not locked, **if the System detects any person who is going to enter the Door**, it makes the display (12) on and off, and make an announcement for notice.
- (14) **When p turns to negative** (and also increases in its absolute value with $p < 0$), **the System has detected a violation of the rule.**
Thus it turns the flash light on and **takes a photo** from front of the person who has just entered the Door. And it displays and announces as 'Since it is detected that more persons than those authenticated have entered the door, a photo is taken for the security reasons. To avoid this inconvenience, please enter the Door after getting authentications.'

Final Solution Concept: A New Control System of Auto-locking Door (Part 4)

Build up a solution concept,
in a consistent way.
Use all your capability!
(Nakagawa)

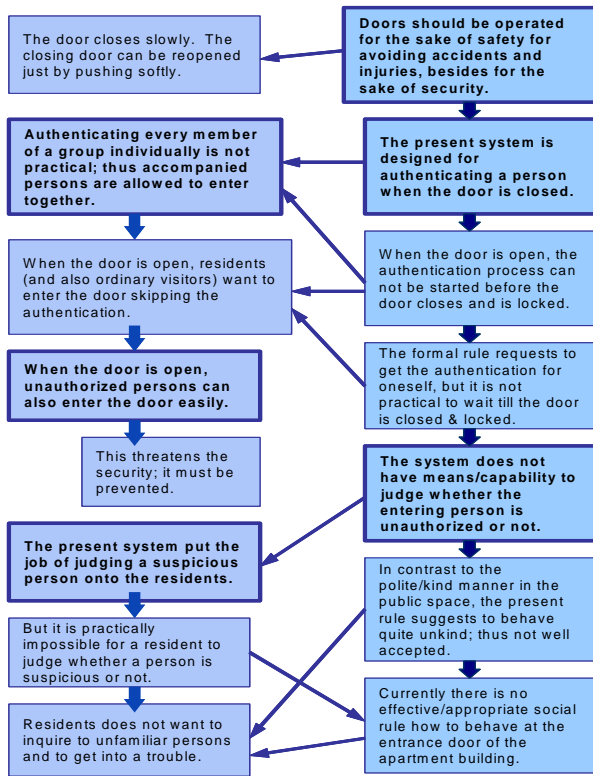

- (15) **While $p > 0$ and nobody has entered for the last preset period of time** (say 10 sec), the System gives the Close-Door direction.
When the Door gets closed and locked, the variables a , e , and p are reset to 0.
- (16) **The records of operations, especially the photos taken, are analyzed later**, desirably every day, by the manager for the purpose of making appropriate means both individually and generally for increasing the security of the building.

Discussions:

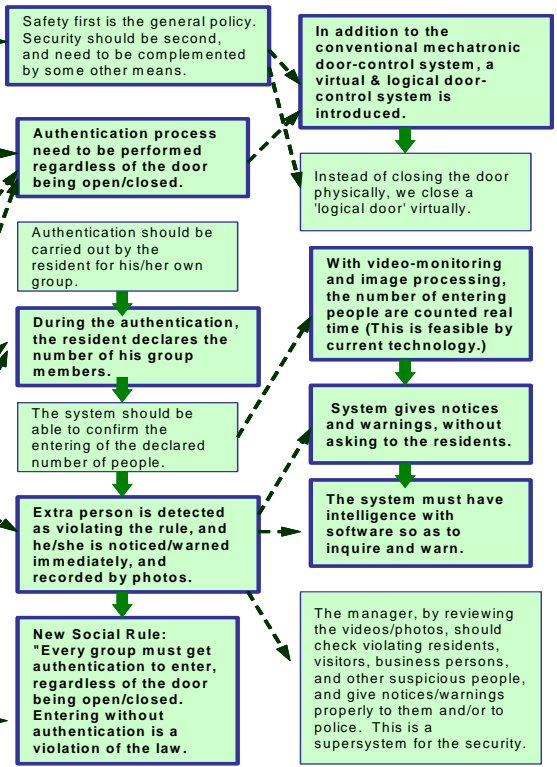

Reconsidering the whole problem TRIZ Thinking (Nakagwa)

Current System:

Problems (results) ← Designs (choices)

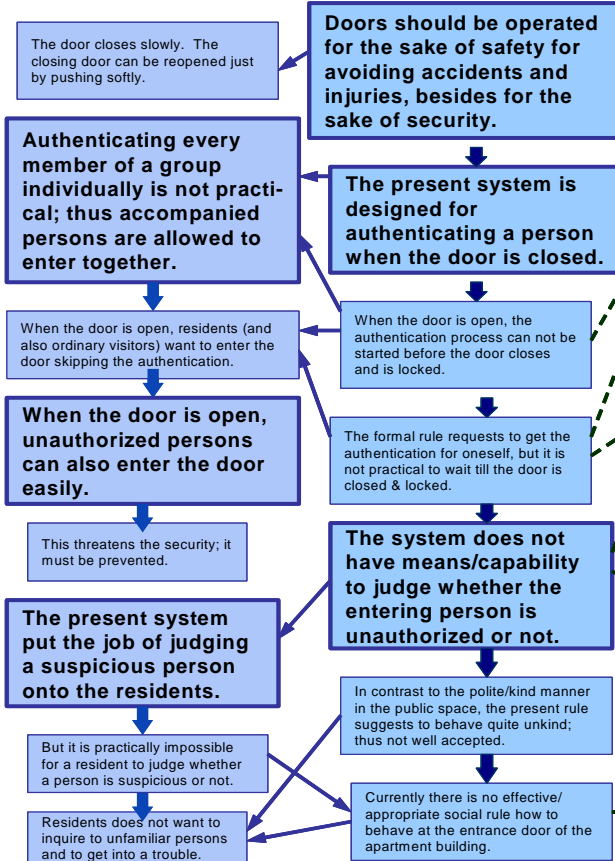

New Solution System New Designs and expectations

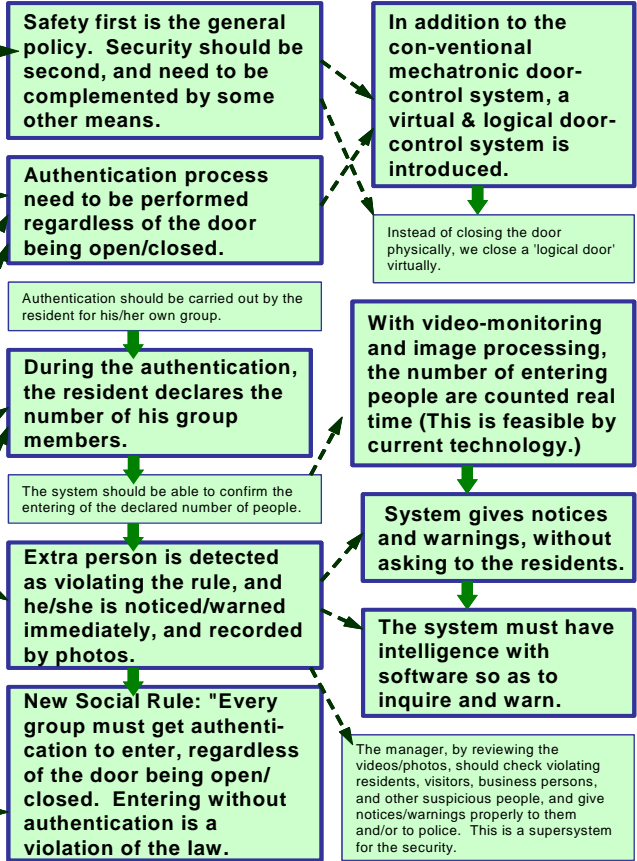

Current System:

Problems (results) ← Designs (choices)

New Solution System New Designs and expectations

Conclusions

The **Auto-locking Door System of apartment buildings** has serious **security problems apparently related to human psychology and social behavior**. We tackled them with TRIZ/USIT.

Analyses and ideas mostly came from students' discussions, guided with TRIZ/USIT and summarized with the KJ Method. They revealed many contradictions and possible solution directions.

A solution concept was built around the idea of **IT-based Logical Door System over the current Electro-mechanical System**.

The solution was designed to solve many contradictions in the current system, with the guide of TRIZ thinking.

All the **psychological and social problems are solved**, hopefully, by the new design choices in the IT-based technology, in this case.
