

**ETRIA
TRIZ Future Conference 2012**

**Establishing General Methodologies of
Creative Problem-Solving / Task-Achieving:
Beyond TRIZ**

Toru Nakagawa

(Professor Emeritus, Osaka Gakuin University, Japan)

October 24-26, 2012

New Lisbon University, Lisbon, Portugal

Introduction: Intention of the present study

Motivation: Why the creative problem solving method, TRIZ, does not penetrate more smoothly among (especially younger) people?

What should we do?

Recognition and Approach:

- (1) TRIZ is strong in technological cases, but weak in non-technological cases where mechanisms are complex and not clear.
- (2) The difficulty of spreading TRIZ is a “common” type of problem in non-technological area related to people, organizations, and society.
- (3) Thus I tried to tackle this problem with all my capability of TRIZ and others.
- (4) I built many models to understand the problem from different aspects. They helped me to proceed step by step to find our new general target and directions to achieve it.

Steps of the present study with multiple modeling

Model (a) of a person to learn TRIZ

Model (b) of an engineer and an industry to learn and accept TRIZ

Model (c) of activities of TRIZ promoters (in Japan)

Model (d) of areas where the application of TRIZ is desired.

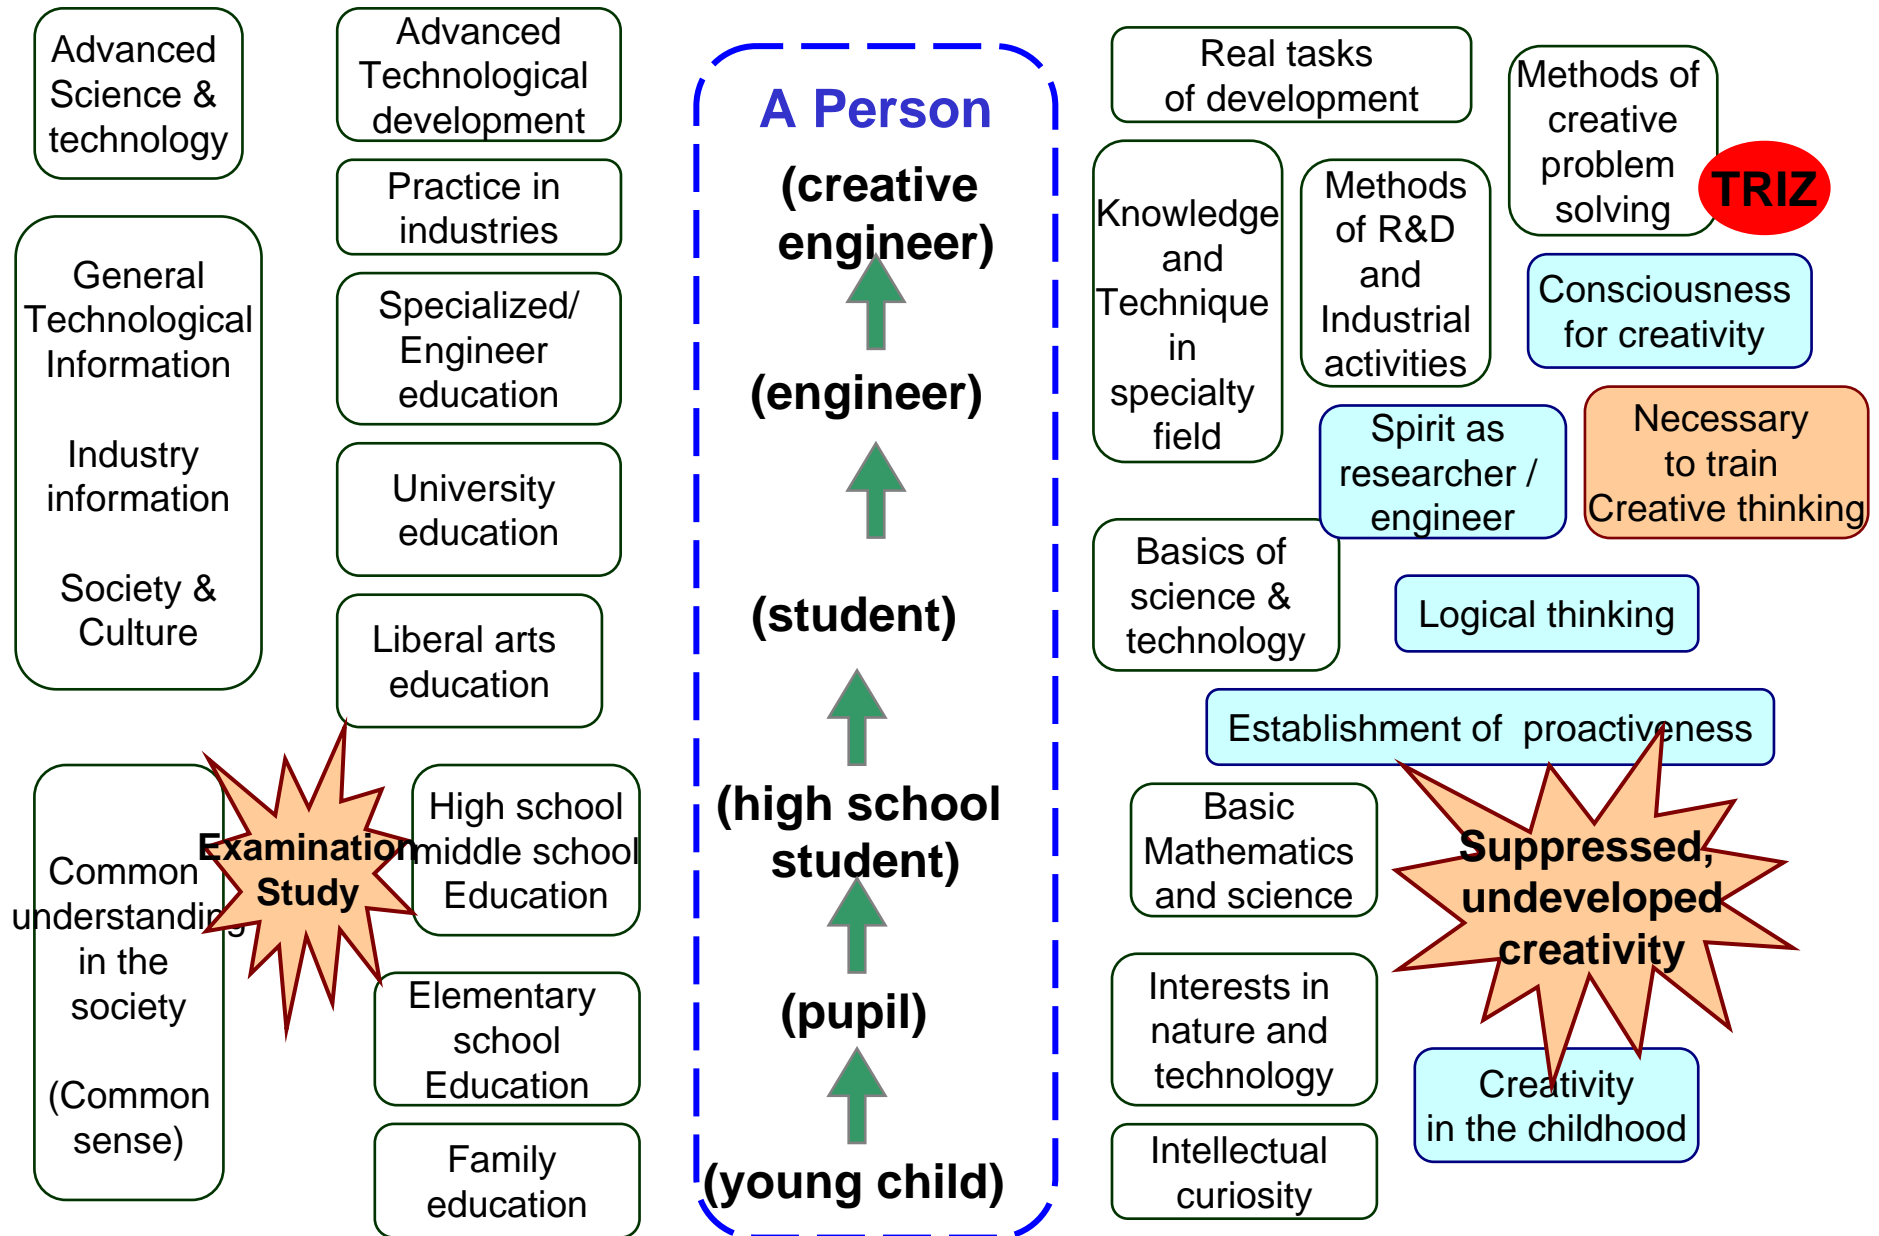

The models have guided us to a new target at a higher level:
'General methodology of creative problem solving'

Model (e) of activities to achieve the new target

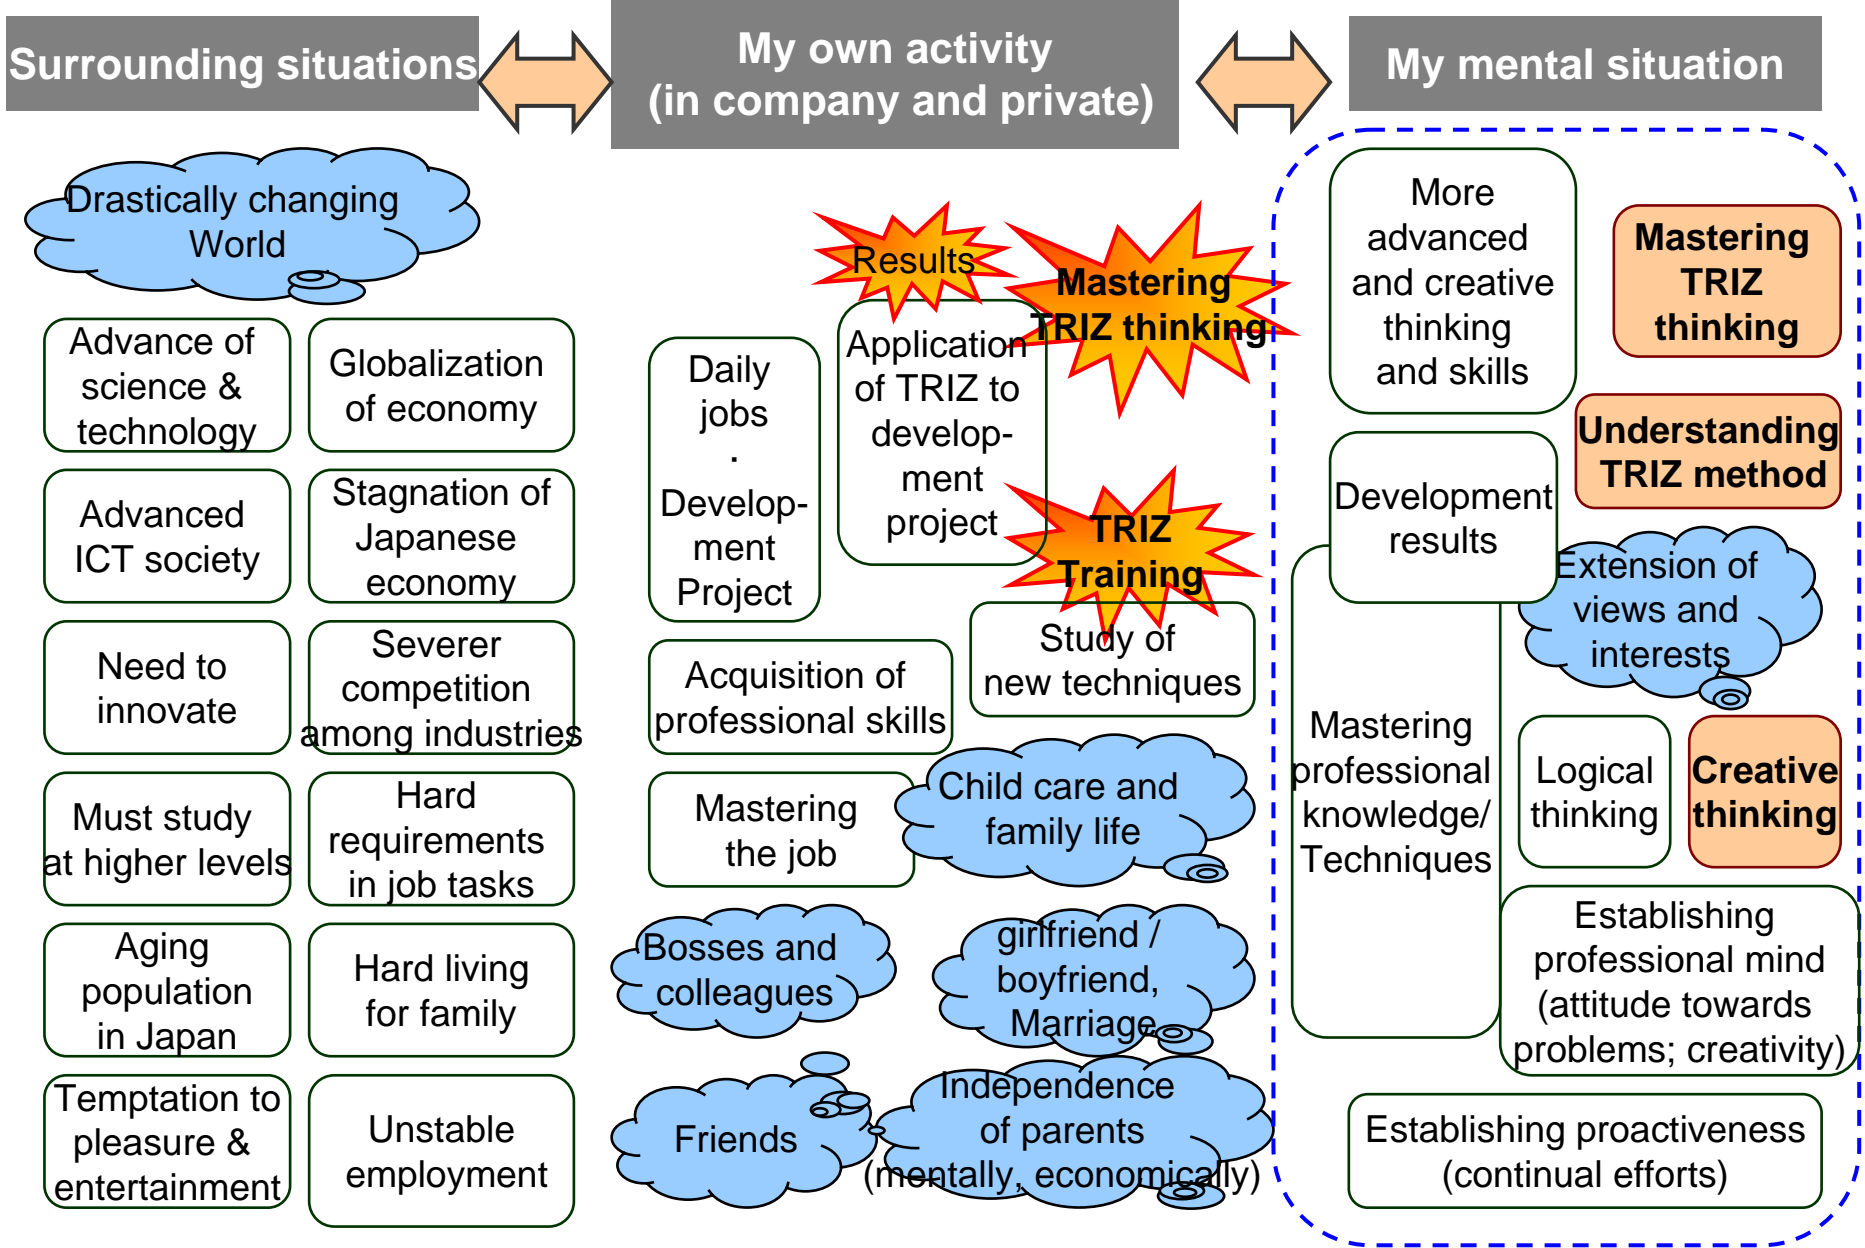

Model (f) of the contents of the new target methodology

-- Discussions

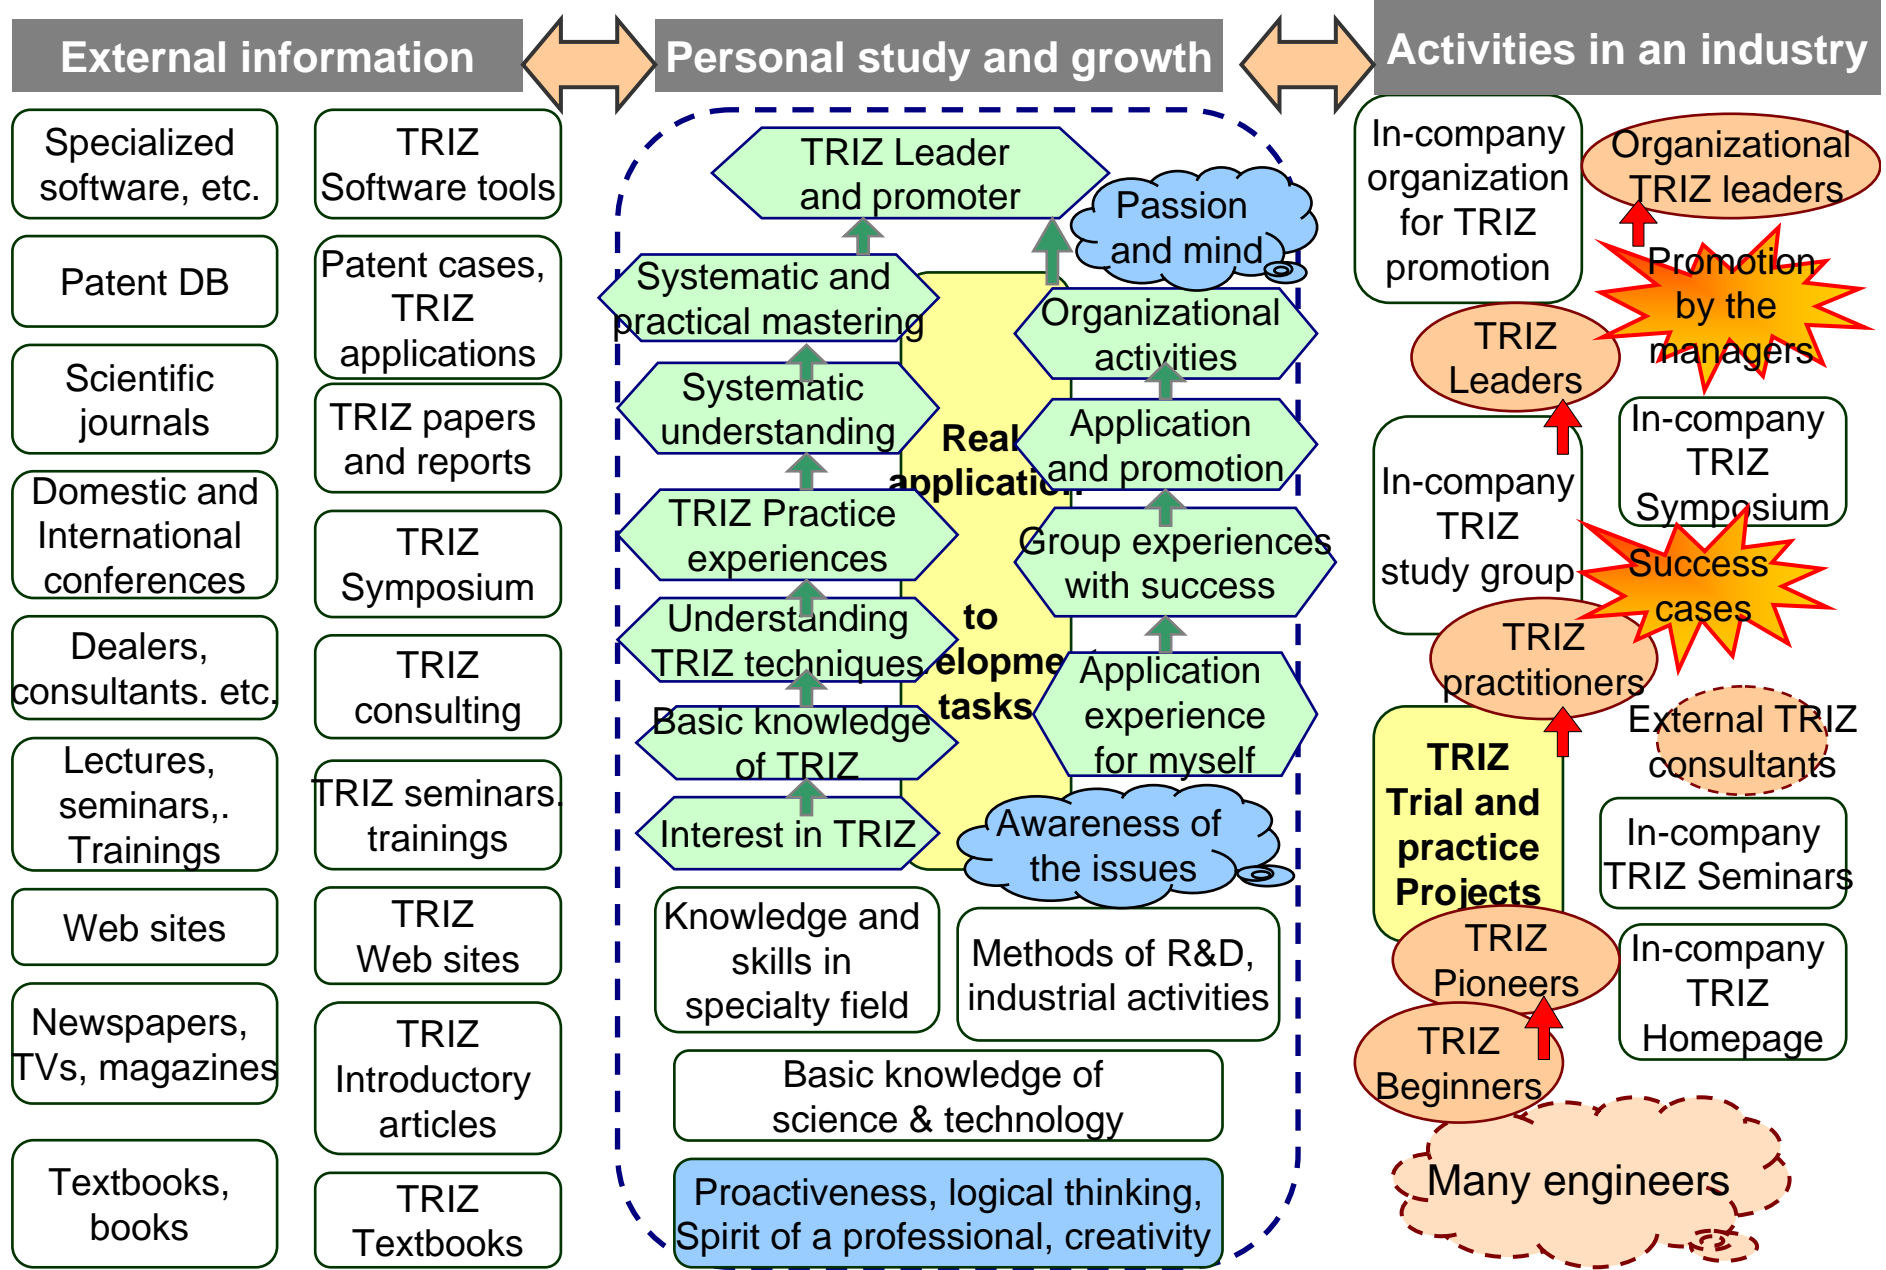

Model (a) of a person to learn and master a technique like TRIZ

Model [A-5] of positioning (in life) of studying TRIZ (Part 2) Young engineers

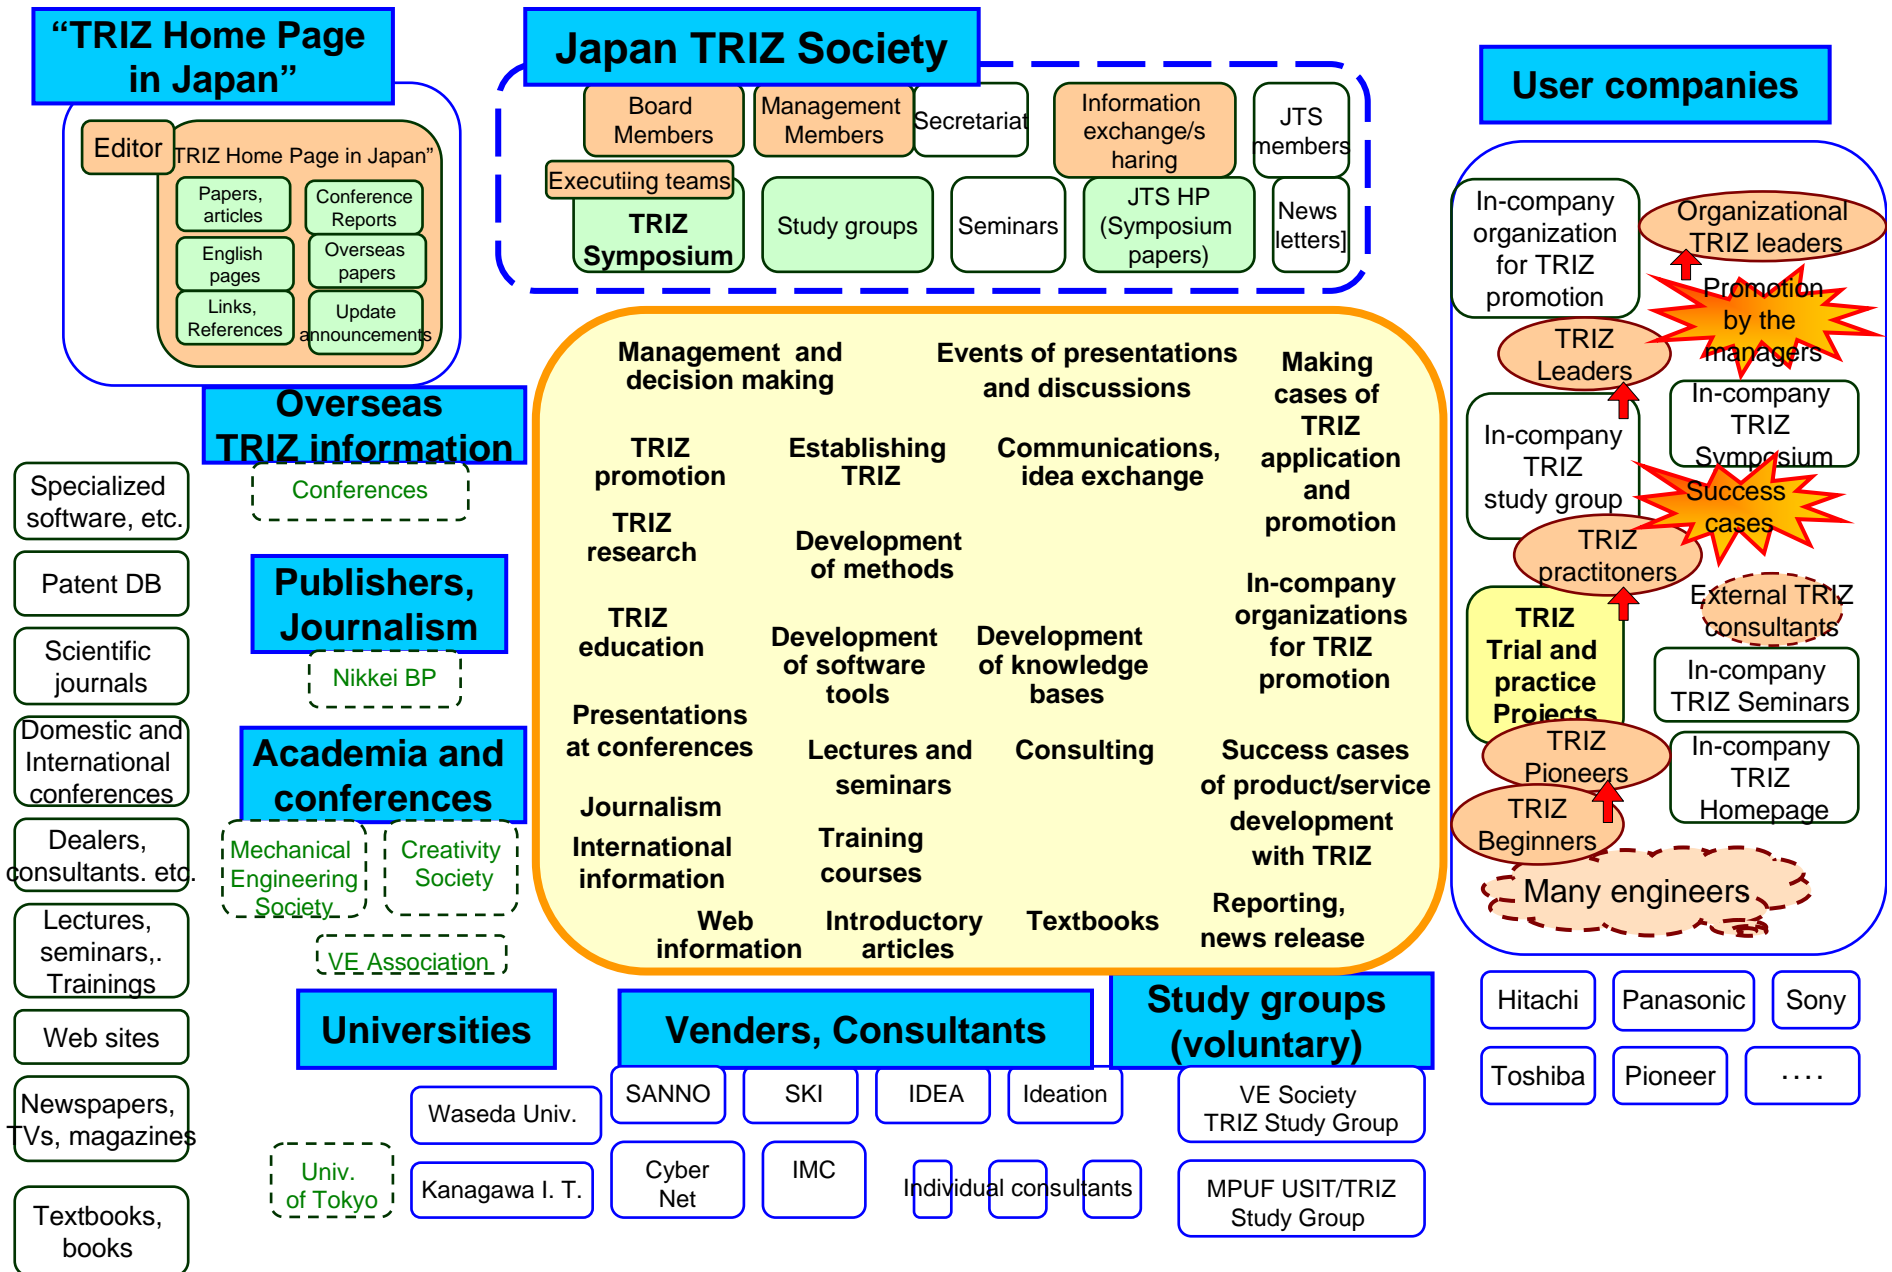

Model (b) of activities for an engineer and a company to learn and master TRIZ

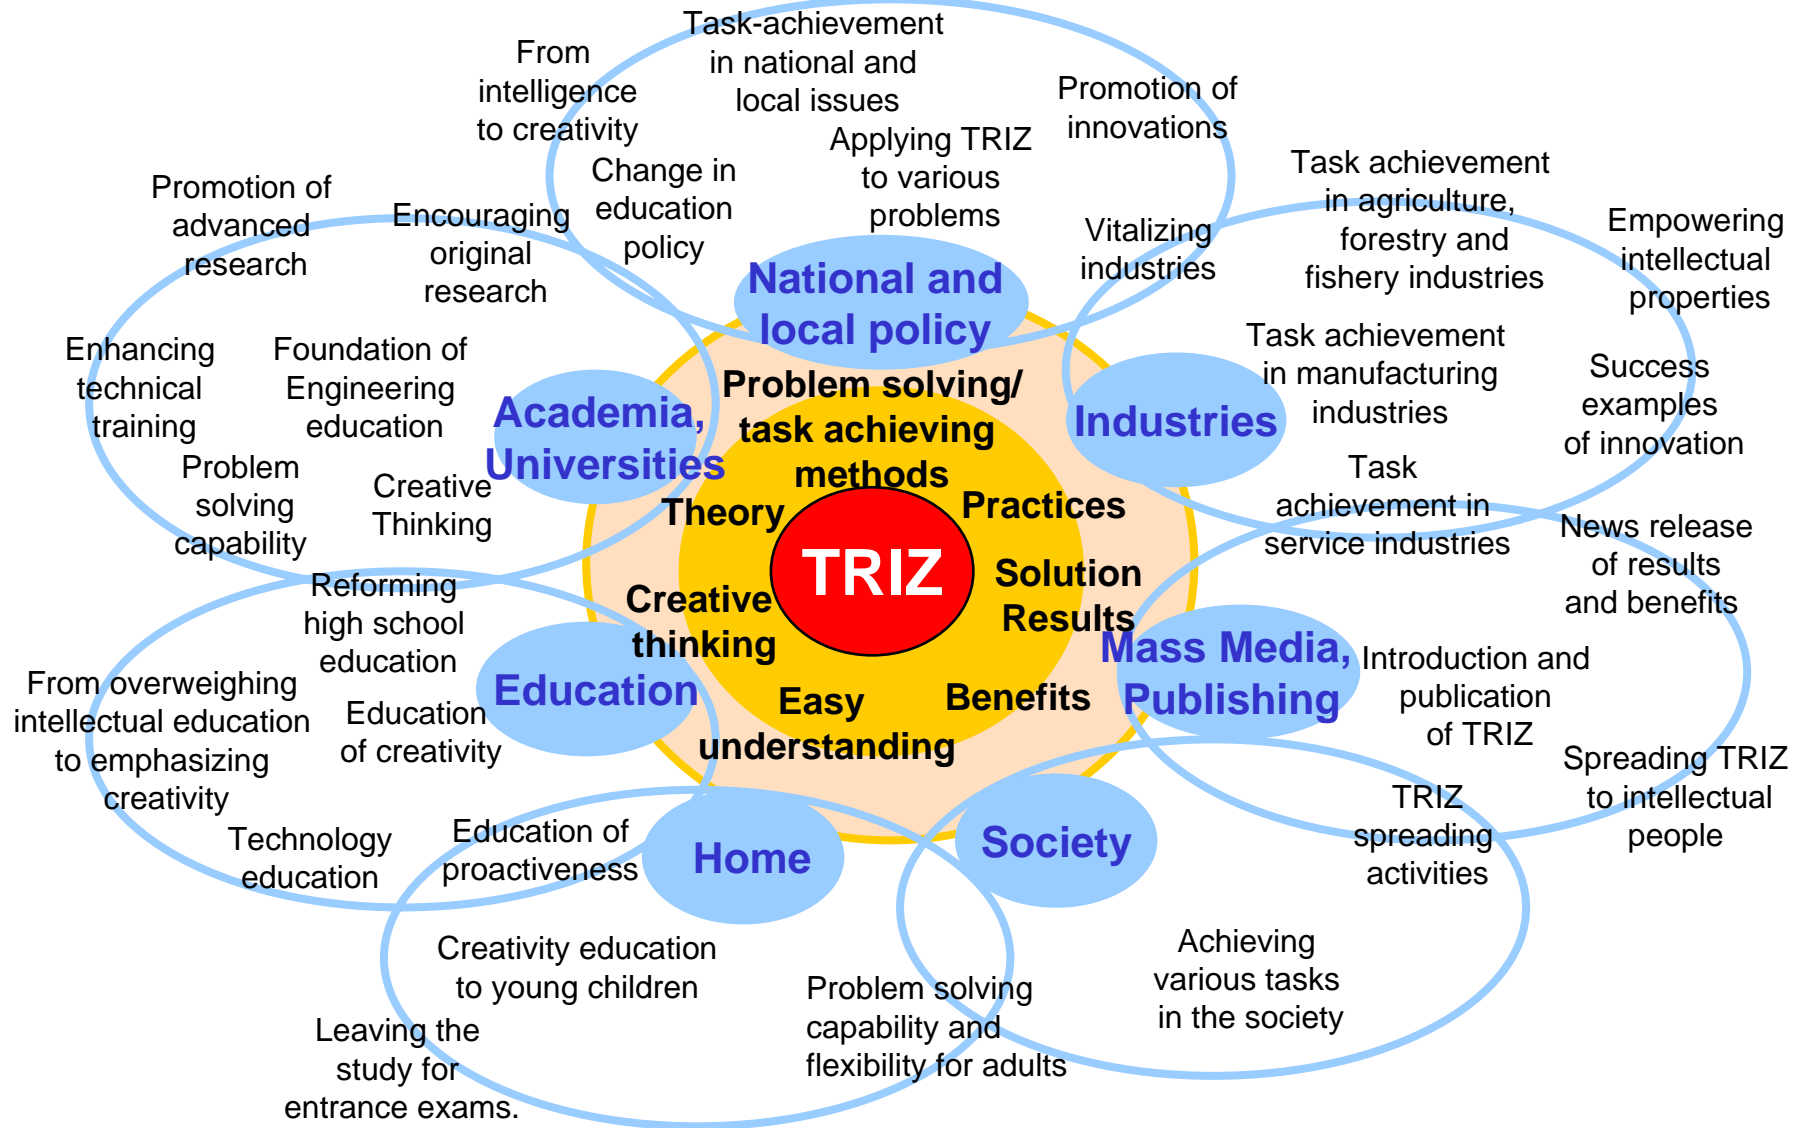

Model [B-1] of activities of TRIZ promoters (Case 6) T. Nakagawa (OGU)

Model (c) of overall activities of TRIZ promoters in Japan (Merged)

Model (d) of areas for TRIZ application → Our new general target

We put TRIZ in the center. But we need a more general method !

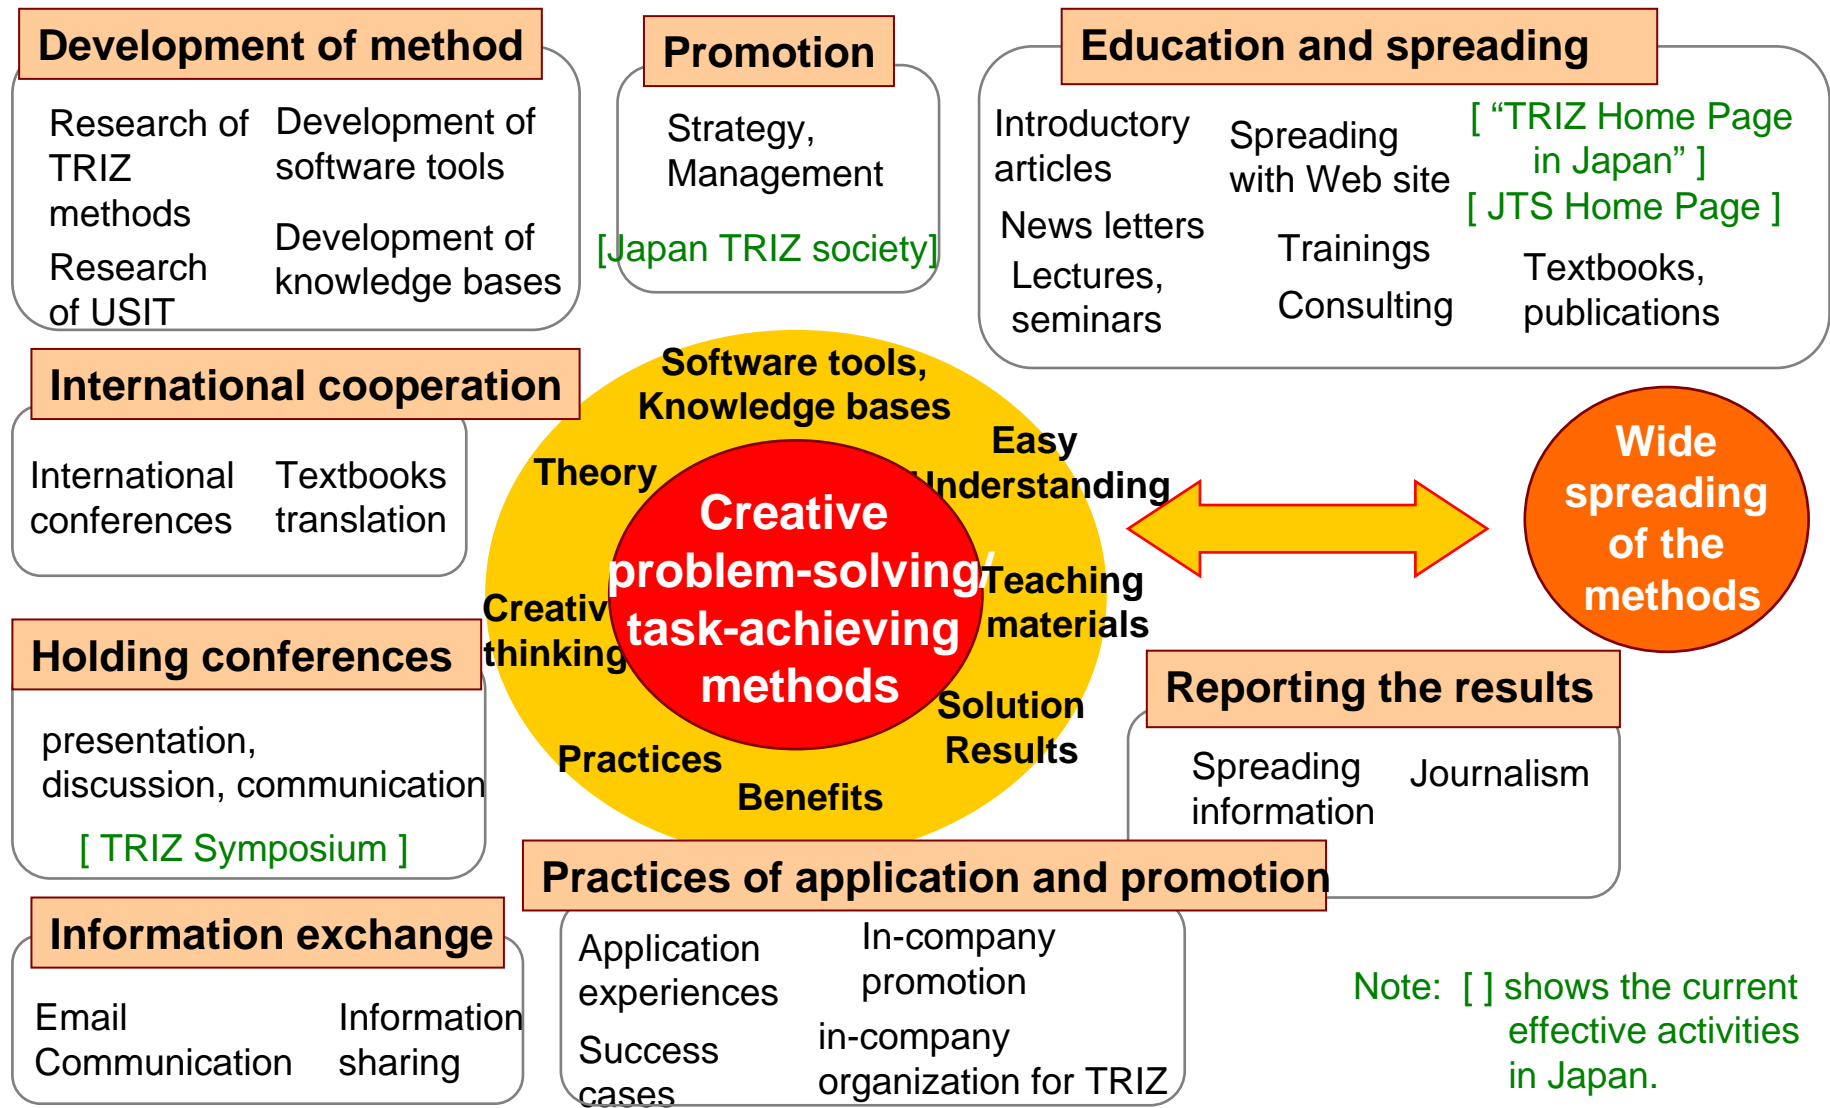

The models have guided us to a new target at a higher level.

General Target :

**To establish a methodology of
creative problem-solving / task-achieving,
to spread it widely, and
to apply it
to problem-solving and task-achieving jobs
in various domains
in the whole country (and the world)".**

Model (e) of activities for achieving the new tasks

Task: To establish a methodology of creative problem-solving / task-achieving, and to spread it widely

Model (f) of "General Methodology of Creative problem-solving" (Outline)

For technological problems

- (0) Whole procedure
- (1) Finding the problem
- (2) Understanding the present system
- (3) Imaging the ideals
- (4) Generating ideas
- (5) Constructing solutions

For non-technological problems

- (0) Whole procedure
- (1) Finding the problem
- (2) Understanding the present system
- (3) Imaging the ideals & visions
- (4) Generating ideas
- (5) Constructing solutions

Further extension of TRIZ
guided by the new paradigm of the 6-Box Scheme of USIT

Model (f1) of "Creative problem-solving/task-achieving methods" (for technology)

Requirements at the preceding stage

- Applicable widely to science & technology
- Mechanical, electrical/electronic, chemical, etc.
- biological, medical, etc.
- Using effectively the whole information in science & technology
- Implementing the S & T information in the method.
- Effectively using patent information
- Possible to use concepts, theories, and methods in the subject-matter fields.
- Use the method of system analysis in the subject-matter field.
- Clear relationships with methods for technology development
- Able to find and understand the problem in the real world
- Able to focus down the problem and clarify the task.
- Able to refer to S & T information whenever necessary
- Able to apply to preparing for patents
- Able to apply for circumventing existing patents.
- Able to transfer knowledge and techniques in other areas.

Able to solve problems creatively in the fields of Science & Technology

Requirements at the succeeding stage

- Able to construct solutions
- Able to use designing techniques in the subject-matter field
- Able to implement the solutions
- Coordinated with methods for implementing solutions (CAD/CAE/CAM, Taguchi method, etc...)
- Able to evaluate the solutions in the real world
- Coordinated with industrial and company infrastructure, e.g., designing, manufacturing, and sales

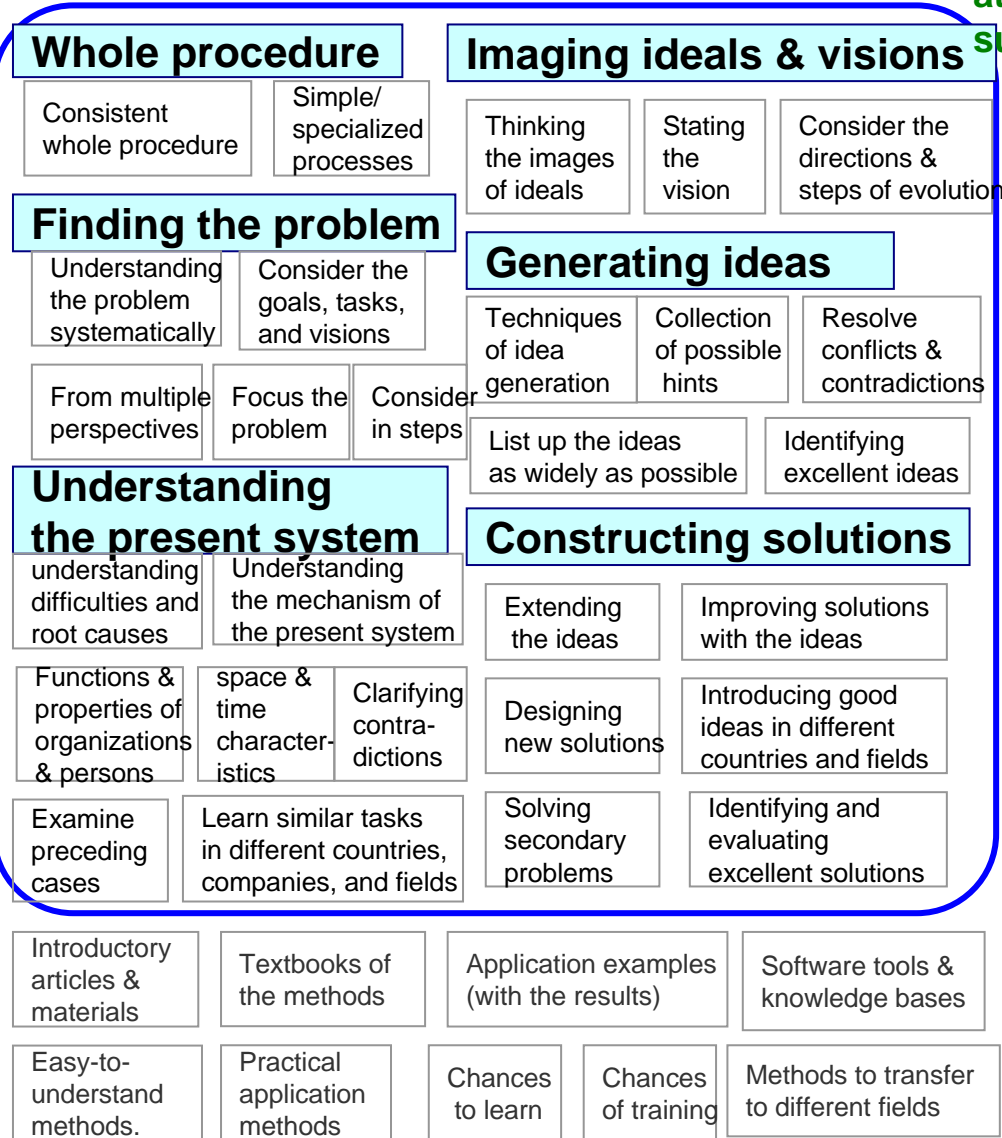

Model (f2) of "Creative problem-solving/task-achieving methods" (for non-technology areas)

Able to solve problems creatively in non-technology fields (e.g., humans, society, business)

Requirements at the preceding stage

Requirements at the succeeding stage

- Applicable widely to non-technological areas
- Areas related to humans, society, business, etc.
- From wide perspectives on world situations, society, etc. and also with delicate sense of humans
- Using various preceding methods
- TRIZ is extended from technical to non-technical areas.
- Effectively using the knowledge of different areas
- Possible to use concepts, theories, and methods in the subject-matter fields.
- Use the method of system analysis in the subject-matter field.
- Considering from wide perspectives on world situation, history, etc.
- Able to find and understand the problem in the real world
- Able to focus down the problem and clarify the task.
- Able to refer to many previous cases and knowledge whenever necessary
- Able to apply for policy making and solution planning
- Able to apply for finding solutions in the cases of serious conflicts of interests/opinions
- Able to merge the knowledge and abilities of all the persons involved

- Able to construct solutions
- Able to use methods and institutions in the subject-matter field
- Able to implement the solutions
- Coordinated with various methods & institutions for implementing solutions
- Solutions are effective and beneficial in the real world
- Coordinated with real-world infrastructures, e.g., society, culture, and environment

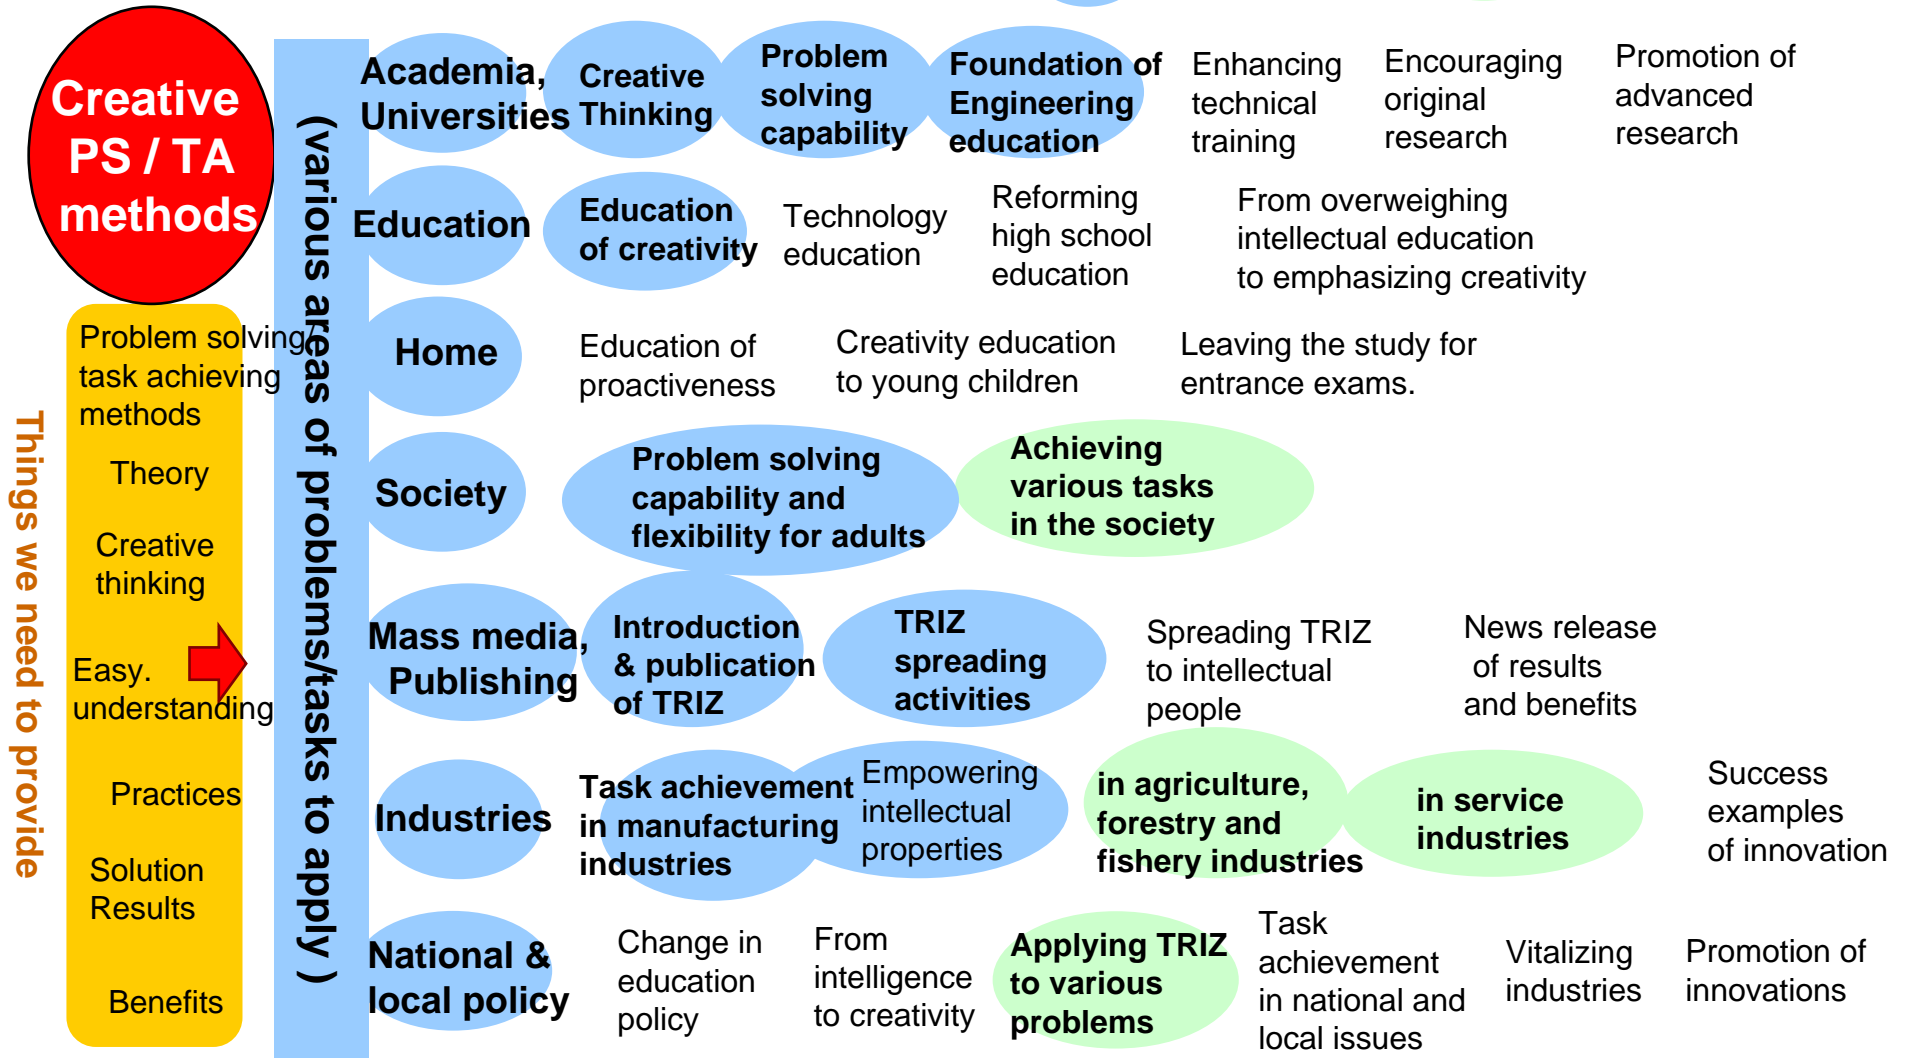

Model [D-5] of areas for applying our 'Creative PS/TA Methods'

Stage 3 in our general target: To apply widely

Emphasis area

Development area

Note: Actually, we should find and get specific opportunities to try and apply the Creative PS/TA methods. Development of the method and extension of application area should be carried out in parallel. .

Concluding Remarks

- (1) For understanding the difficulty in penetrating TRIZ widely, especially to younger people, **multiple models** of the current situations have been built from different aspects.
- (2) One main lesson is that **TRIZ is just one of many items** for a person, e.g., a young engineer, to learn and to handle with in his life and jobs.

Thus, the contents of TRIZ and occasions to convey them should be either **well customized** for the (narrow range of) target persons or **well generalized** for the (wider range of) target persons.

- (3) Individual persons can learn TRIZ from outside information, e.g., textbooks and Webs, from the company's promotion, but **mainly from his personal learning and experiences.**

The accumulation of personal learning and outside impacts in a person is the key to mastering TRIZ (or any other) thinking.

- (4) **For an industry to accept TRIZ**, personal growth of TRIZ practitioners/ leaders, application of TRIZ to real projects, and promotion by the management need to go together.
- (5) TRIZ is applicable in the technological areas and also in the **non-technological areas**.
Thus TRIZ has a very wide range of application areas.
- (6) However, **not TRIZ itself but a more general methodology** is desired for such a wide range of applications.
Thus we have been guided to **a new target at a higher level**.
- (7) **'General methodology of creative problem solving'** is expected to be a further extension of TRIZ, especially guided by the 6-Box Scheme of USIT.
- (8) Realizing the higher level target, we will be able to **choose correct directions** in our application, development, and promotion activities.

- (9) Models are drawn in **informal diagrams**, without any pre-fixed rules or format. Flexibility is important for viewing from different aspects. Diagrams are more useful than sentences for describing the structure of the situations/systems.
- (10) In the modeling, **the systemic thinking in TRIZ** is fully used.
- (11) **The process of the present study** is guided by the 6-Box Scheme of USIT, and is actually an illustration of the general methodology of creative problem solving, to be pursued in the new target.
- (12) In the present study, **macroscopic views** are used in the modeling and hence the solution obtained is also macroscopic and abstract. If we use microscopic, specific views, we would obtain microscopic, specific solutions.
- (13) The models **should be discussed and shared** in the TRIZ community.
