### The 9th TRIZ Symposium in Japan September 5 - 6, 2013

# General Methodology for Creative Problem Solving and Task Achieving — Its Plan—

Toru Nakagawa
Osaka Gakuin University, Professor Emeritus

September 6, 2013

Institute of Mathematical Statistics (Tachikawa, Tokyo)

#### **Contents:**

#### Part 1: Beyond TRIZ, A New Target at a higher level

How TRIZ can be learned and applied in real jobs in industries?

Where can we expect to apply TRIZ? What people want there?

==> A New Target: General methodology for creative problem solving

#### Part 2: Strategies for establishing the new target

Reviews of different approaches for creative problem solving Basic strategies for establishing the new general methodology

### Part 3: Conceptual plan of the general methodology of creative problem solving

One for technological applications and Another for non-technological applications

#### Part 1: Beyond TRIZ, A New Target at a higher level

Motivation: Why the creative problem solving method, TRIZ, does not penetrate more smoothly among people?

I built up a number of models to consider this problem.

Model of a person to learn TRIZ

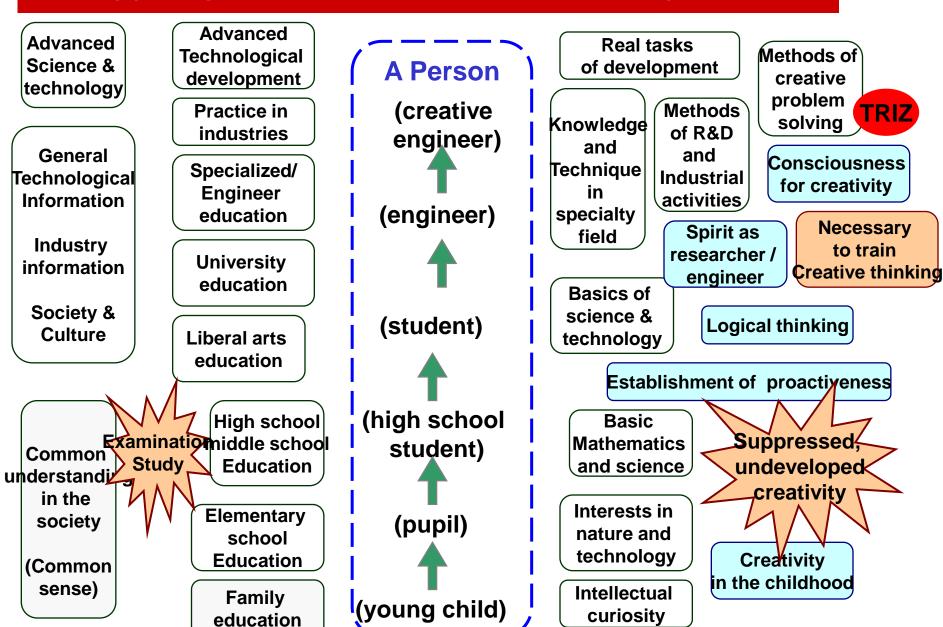

Model of an engineer and an industry to learn and accept TRIZ

Model of areas where the application of TRIZ is desired

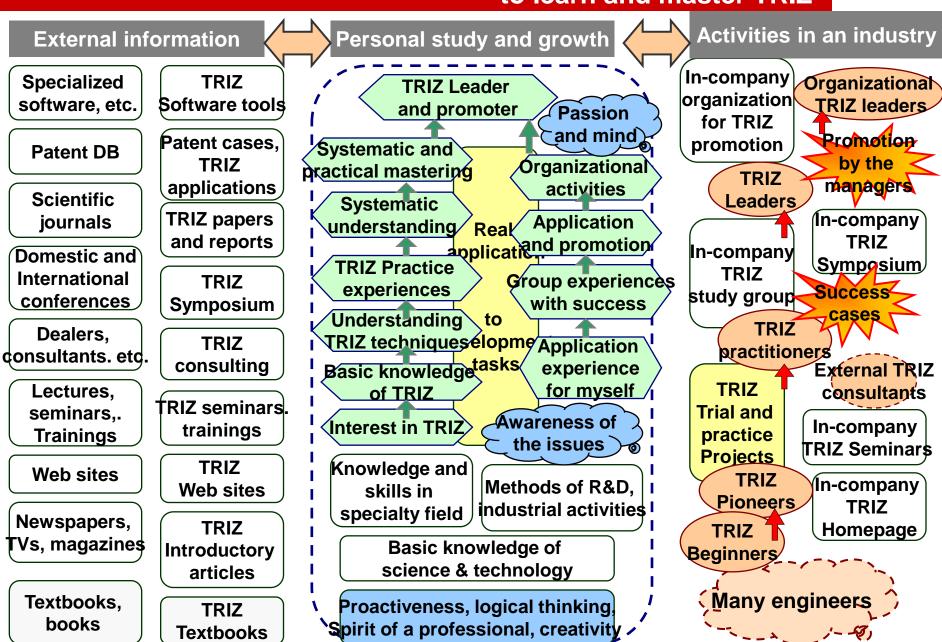

==> People in the wide range of application areas of TRIZ want not TRIZ itself but more general methodology effective for creative problem solving

(Nakagawa, Japan TRIZ Symposium 2012)

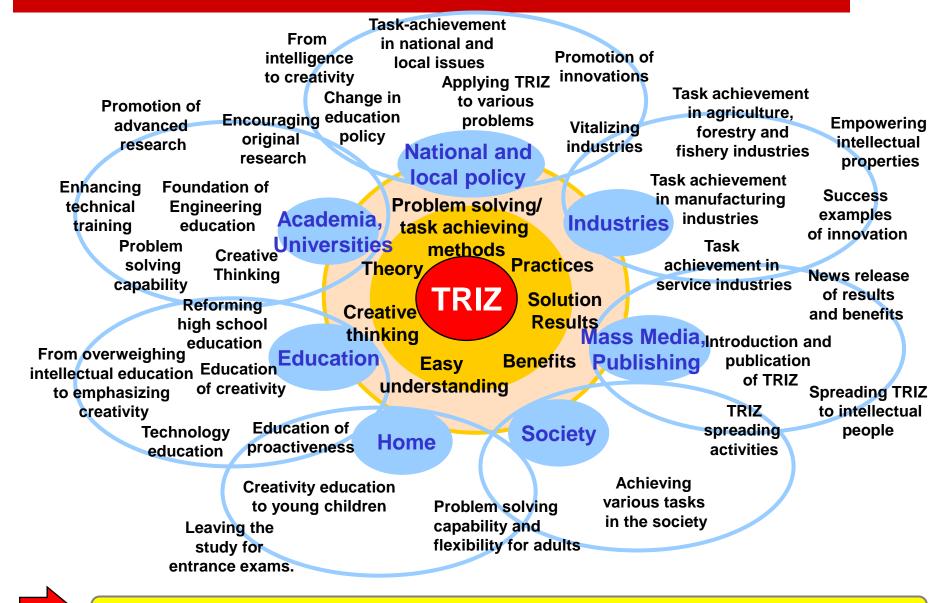

#### Model (a) of a person to learn and master a technique like TRIZ

### Model (b) of activities for an engineer and a company to learn and master TRIZ

#### Model (d) of areas for TRIZ application → Our new general target

#### **Conclusions for Part 1**

- (1) Recognizing 'TRIZ is just one of many subjects for a person to study', the contents of TRIZ should be either well customized for the (narrow range of) target persons or well generalized for the (wider range of) target persons.
- (2) Individual persons can learn TRIZ from outside information and promotion, but mainly from his/her personal learning and experiences.
- (3) For an industry to accept TRIZ, personal growth of TRIZ practitioners/ leaders, application of TRIZ to real projects, and promotion by the management need to go together.
- (4) TRIZ is applicable in the technological as well as non-technological areas. Thus TRIZ has a very wide range of application areas. However, not TRIZ itself but a more general methodology is wanted. Thus we have been guided to a new target at a higher level.

### The models have guided us to a new target at a higher level.

a new target at a higher level.

To establish a general methodology of creative problem-solving / task-achieving,

to spread it widely, and

to apply it to problem-solving and task-achieving jobs in various domains in the whole country (and the world)".

#### **Part 2:**

Strategies for establishing the new target

Reviews of different approaches for creative problem solving

Basic strategies for establishing the new general methodology for creative problem solving

### Conventional methods for Creative Problem Solving & Task Achieving:

- (a) Basic approach in science & technology: Principles, theories, application & design methods in each discipline.
- (b) Approaches learning from cases: Building and using case bases and knowledge bases
- (c) Approaches to analyze the problems and tasks: Cause-effect, system, mechanism, etc.
- (d) Approaches to support idea generation: generating as widely and as freely as possible,
- (e) Approaches to arrange environment and take care of mental aspects: relaxed feeling, free atmosphere, thinking the ideals, etc.
- (f) Approaches for realizing the idea: Selecting good ideas, designing & development, implementation, etc.: technologies in the discipline.
- (g) Approaches for thinking the future and suggesting the directions:
- (h) Approaches towards general methodologies for problem solving:

Integrating all the approaches above to build a methodology useful and practical.

A system of methods suitable for each type/field of problems and tasks, and also a system of methods universally applicable to a wide range of types and fields.

#### Various methods for creative problem solving & task achieving

	<u> </u>	
Approach	Examples in conventional methods	Examples in TRIZ/USIT
Basics in Science & Technology	Principles, theories & models in each discipline; knowledge bases	Knowledge bases of physical effects
Learning from cases	Analogical thinking, Collections of hints, Equivalent transformation thinking	Active use of patent databases
Analyzing problems/ tasks	Mind mapping, KJ method (Affinity method), Quality function deployment (QFD), QC tools, Root cause analysis, Value engineering (VE), Functional analysis	Problem definition, Root cause analysis, Function & attribute analysis, Formulating contradictions, Substance-field modeling
Supporting idea generation	Brain storming, Brain writing, SCAMPER	40 Inventive Principles, 76 Inventive standards, Contradiction matrix, USIT operators
Taking care of environment and mental aspects	Brain storming, Facilitation methods, Cynectics, NM method, 'The 3rd alternatives'	Size-Time-Cost (STC) operators, Smart little people (SLP) modeling, Particles method
Realizing the ideas	Design methods in each discipline, Pugh's method, CAD/CAE, Taguchi method	Technical knowledge bases
Foreseeing the future	Using various statistics, Delphi method, Scenario writing	9 Windows method, Trends of technical evolution, S-curve analysis, DE (Directed evolution)
Towards a general methodology	Four -box scheme of abstraction, analogical thinking, Equivalent transformation thinking	Four-box scheme, ARIZ, Six-box scheme of USIT

#### Clarifying the Target of Our New Methodology

### "A General Methodology for Creative Problem Solving & Task Achieving"

- Help to solve problems (i.e., undesirables) and to achieve tasks (i.e., desirables).
- Capable to guide to new creative solutions and measures even for the problems/tasks conventionally thought difficult/impossible.
- Applicable generally and universally to different fields/areas
- Having integrated preceding different methods and different studies
- Delivering a methodology (a system of methods) which integrates various thinking methods, techniques, tools, etc.
- Easy to learn, easy to apply, and effective in actual jobs of application.

"A General Methodology for Creative Problem Solving & Task Achieving"

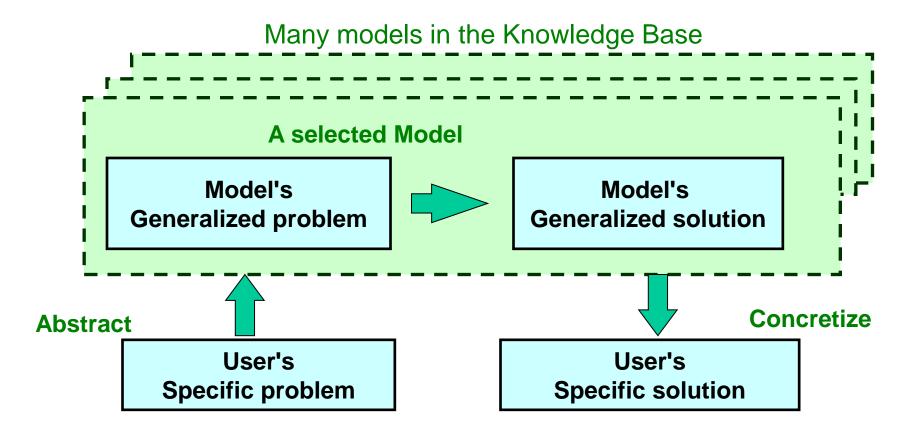

#### Principal strategies for establishing it:

- (A) As the paradigm (or basic scheme), we adopt the 'Six-Box Scheme'. (<= Conventionally the 'Four-box scheme' in science & technology, and TRIZ)
- (B) We build one for technology and another for no-technology, in parallel.
- (C) Based mainly on the data-flow representation. (<= flow-chart)</p>
  Clarifying the input, intermediate, and output information.
  Specifying the concepts and methods for representing information.
- (D) The ways and processes for acquiring/deriving information may have multiple alternatives. (Allow different alternative processes.)
- (E) Take care of mental/psychological aspects of problem solvers and stakeholders.
- (F) Establish first the methods in the Thinking World in the Six-box scheme and then the connections to the pre/post methods in the Real World.
- (G) We first analyze and describe the methods in TRIZ/USIT under these strategies, and then various other conventional methods.

#### On Strategy (A)

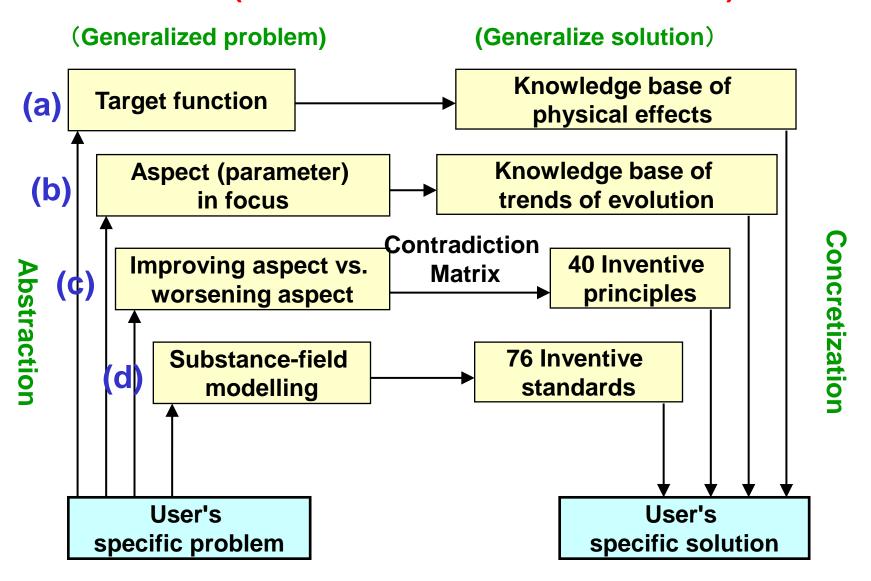

### Basic scheme for Problem Solving (Conventional: "Four-Box Scheme)

Science & Technologies (Many models, specialized in areas)

Contents in the boxes cannot be explained generally, depending on the models. Mapping onto the model's problem, and use the model's solution as a hint.

#### Tools of TRIZ (Based on the Four-Box Scheme)

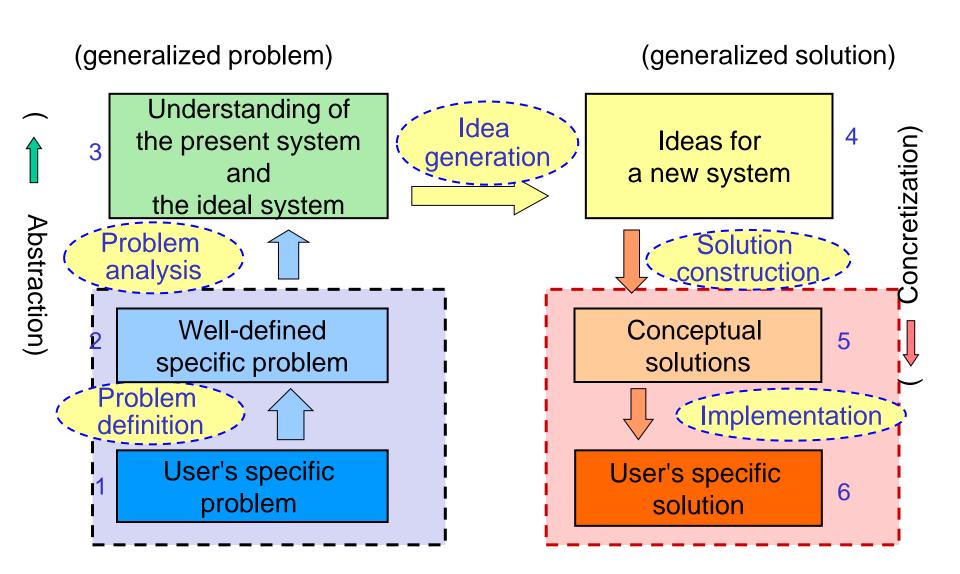

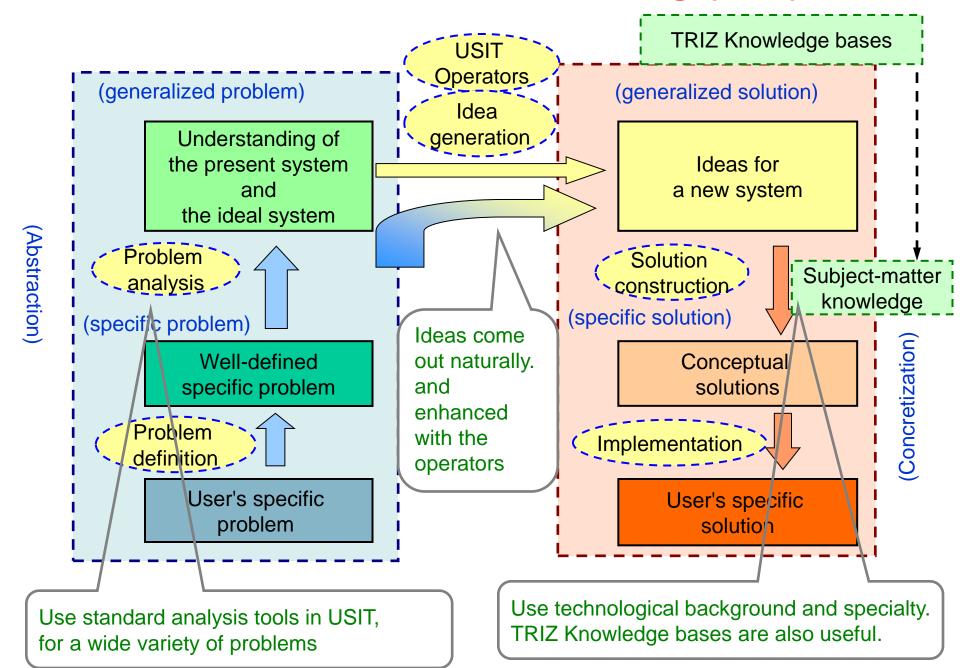

Essence: Many tools and huge knowledge bases are applicable across technical fields.

But parallel structure of multiple tools = partialness in each method

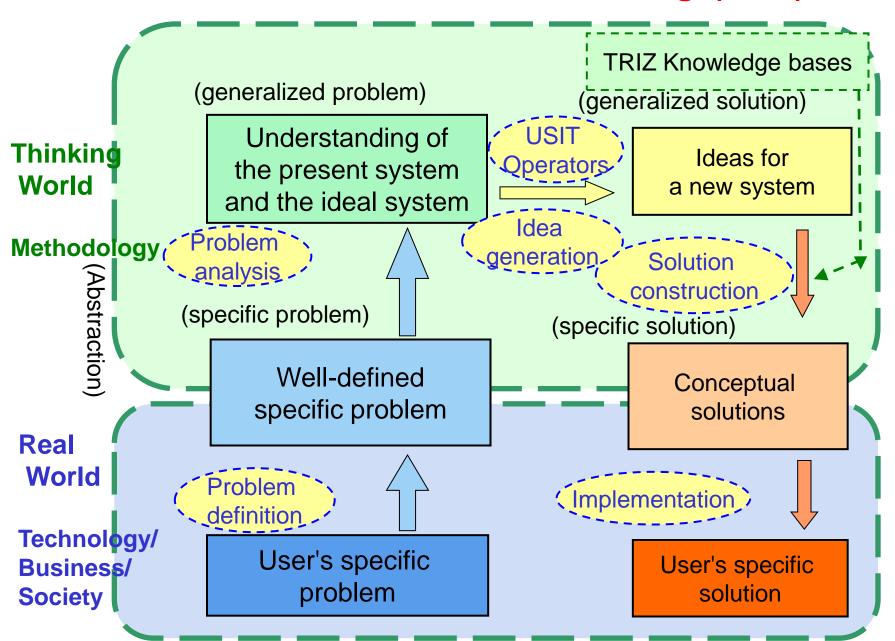

#### Toru Nakagawa (2005)

### Six-Box Scheme of USIT: New Paradigm for Creative Problem Solving

#### 6-Box Scheme of Creative Problem Solving (USIT)

#### On Strategy (B)

#### General Methodology of Creative Problem-Solving (Outline)

#### For technological problems For non-technological problems

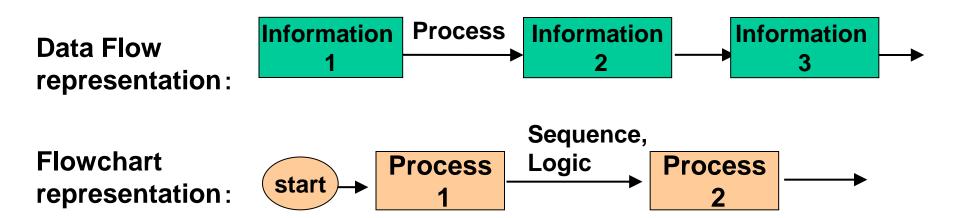

- (0) Whole procedure
- (1) Finding the problem
- (2) Understanding the present system
- (3) Imaging the ideals
- (4) Generating ideas
- (5) Constructing solutions

- (0) Whole procedure
- (1) Finding the problem
- (2) Understanding the present system
- (3) Imaging the ideals & visions
- (4) Generating ideas
- (5) Constructing solutions

We should build these two in parallel. Essential components of the two are very similar.

#### On Strategy (C)

We use the data-flow representation mainly.

Data Flow describes the in/out and intermediary information as requirements.

For describing information, it is important to specify the concepts and the representation methods.

In Flowcharts, the information to be handled are implicit, not specified explicitly.

Data Flow representations are more basic and stable than the Flowcharts.

#### On Strategy (D)

## The ways and processes for acquiring/deriving information may have multiple alternatives. (Allow different alternative processes.)

- This strategy concerns to some details of the component methods.
   We will not get involved in the differences in details;
   We will allow multiple alternative ways of processing.
- It will never work if we try to specify the ways of human thinking process.

We should be free in the thinking process, especially in creative thinking.

We should better appreciate many conventional methods, in their merits.

We should know the positions of them in our general framework.

#### On Strategy (E)

### (E) Take care of mental/psychological aspects of problem solvers and stakeholders.

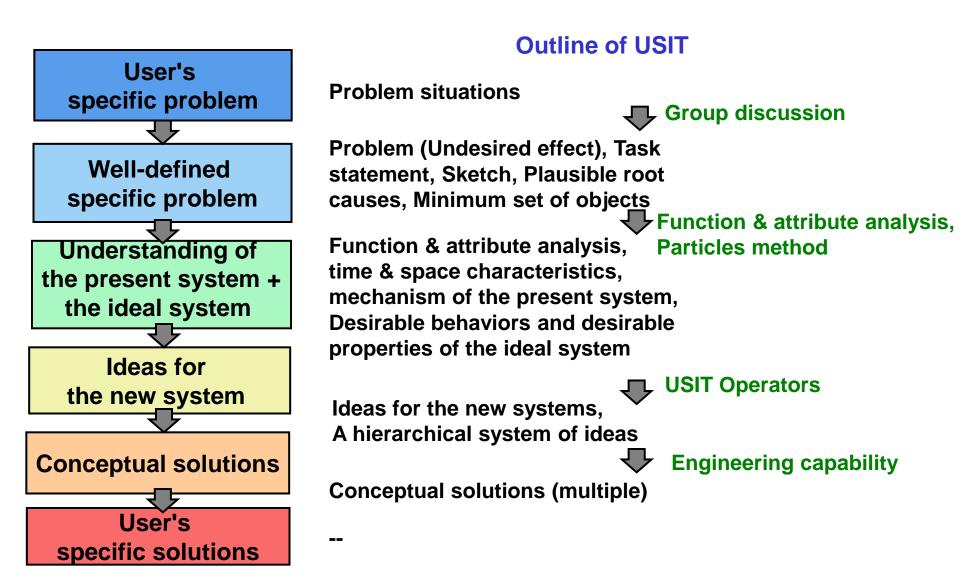

- Important to have free & relaxed atmosphere.
- Need to break fixed thinking and psychological inertia.
- Group work and its facilitation are important.
- In the non-technological fields, principal difficulty lies in the differences in the value/interests evaluation among the stakeholders (including the problem solvers) reflecting their different situational positions and senses of values.
- Attitudes and minds of the stakeholders are often the keys to the success in problem solving.
- Necessary to include intentions and feelings in the description of problem situations.

#### On Strategy (F)

- (F) Establish first the methods in the Thinking World in the Six-box scheme and then the connections to the pre/post methods in the Real World.
  - The methods inside the Thinking World are relatively clear now.
     There exist many methods for creative problem solving.
     There remain a number of methods to be developed further
  - In the Real World (of the Six-box scheme), a lot to be developed:
    - In which situations/stages, should we use our general methodology?
    - How can we catch the problems/tasks in the Real World and how can we formulate them into the 'Well-defined specific problems' to be handled in the Thinking World?
    - What procedures should we take for implementing the conceptual solutions (of the Thinking World) into the real solutions in the Real World?
  - We should better build our general methodology first by separating the issues of cooperating in the Real World.

#### On Strategy (G)

(G) We first analyze and describe the methods in TRIZ/USIT under these policies, and then various other conventional methods.

#### **Part 3:**

Conceptual plan of the general methodology of creative problem-solving & task-achieving

One for technological applications and

Another for non-technological applications

in parallel

#### General method for creative problem-solving/task-achieving (for technology)

#### Whole procedure

Consistent whole procedure Simple/specialized processes

#### Finding the problem

Understanding the problem systematically Consider the goals and tasks

Consider from broad perspectives

Focusing the problem

#### **Understanding** the present system

understanding difficulties and root causes

Understanding the mechanism of the present system

**Functions** & attributes space & time characteristics contradictions

Clarifying

**Examine various** present solutions

Learn similar tasks in different fields

#### Imaging the ideals

**Thinking** the images of the ideals Desirable behaviors & properties

Consider the direction of evolution

#### **Generating ideas**

Techniques of idea generation

Collection of possible hints Resolve contradictions

Generate ideas as widely as possible

Identifying excellent ideas

#### **Constructing solutions**

Extending the ideas

Designing new solutions

Solving secondary problems

Improving solutions with the ideas

Introducing good ideas used in different fields

Identifying and evaluating excellent solutions

#### General method for creative problem-solving/task-achieving

Requirements at the preceding stage

(for technology)

Requirements at the succeeding stage

Applicable widely to science & technology

Mechanical, electrical/electronic, chemical, etc.

biological, medical, etc.

Using effectively the whole information in science & technology

Implementing the S & T information in the method.

Effectively using patent information

Possible to use concepts, theories, and methods in the subject-matter fields.

Use the method of system analysis in the subject-matter field.

Clear relationships with methods for technology development

Able to find and understand the problem in the real world

Able to focus down the problem and clarify the task.

Able to refer to S & T information whenever necessary

Whole procedure

Finding the problem

**Understanding** the present system

**Imaging the ideals** 

**Generating ideas** 

**Constructing solutions** 

Introductory articles & materials

Textbooks of the methods

**Application examples** 

Software tools & knowledge bases

Easy-tounderstand methods.

Practical application methods

Chances to learn

Chances of training

Able to construct solutions

Able to use designing techniques in the subject-matter field

Able to implement the solutions

Coordinated with methods for implementing solutions (CAD/CAE/CAM, Taguchi method, etc...

Able to evaluate the solutions in the real world

Coordinated with industrial and company infrastructure, e.g., designing, manufacturing and sales

### General method for creative problem-solving/task-achieving (for non-technology fields) (e.g., humans, society, business)

#### Whole procedure **Imaging ideals & visions** Simple/specialized Consistent Thinking the **Stating** Consider the directions whole procedure processes images of ideals the vision & steps of evolution Finding the problem **Generating ideas** Understanding Consider the goals, the problem Resolve tasks, and visions Collection of systematically Techniques of conflicts & idea generation possible hints contradictions From multiple Focus the Consider perspectives problem in steps List up the ideas Identifying as widely as possible excellent ideas **Understanding** the present system **Constructing solutions** understanding Understanding the mechanism of difficulties and Extending Improving solutions the present system root causes the ideas with the ideas Functions & space & time Clarifying properties of Designing Introducing good ideas in charactercontraorganizations different countries and fields new solutions istics dictions & persons Examine Learn similar tasks Solving secondary Identifying and evaluating in different countries, preceding excellent solutions problems

companies, and fields

cases

#### **Concluding Remarks**

- (1) 'General Methodology of Creative Problem-Solving / Task-Achieving' is an integration of many existing methods, including TRIZ, with the basic paradigm of the 'Six-Box Scheme'.
- (2) For the technological application, its framework and components are under construction by TRIZ/USIT, and we need to integrate them with various other existing methods.

The significance of this vision need to be understood widely, as the basis for technological innovation and creativity education.

(3) For the non-technological application, the framework and basic components are similar to the technological ones.

However, real problems are often much larger, more complex and delicate. Mental/psychological aspects play even larger roles than the tools. We need to develop many and different methods further.

(4) By setting the new target at a higher level, we will be able to make better choices in our activities of development, application, and promotion.

# Thank you for your attention
